HUMAN ENDOCRINE SYSTEM

Answer the questions below!

1. What is the endocrine system?

The endocrine system is a network of glands that produce and release hormones to regulate various functions in the body, including growth, metabolism, and mood.

2. What are hormones and how do they work?

Hormones are chemical messengers produced by glands in the endocrine system. They travel through the bloodstream to specific organs or tissues, where they trigger various biological responses to help regulate bodily functions.

3. Name three key glands in the endocrine system and their functions!

- **Pituitary Gland:** Known as the "master gland," it controls other glands and regulates growth, reproduction, and metabolism.
- **Thyroid Gland:** Produces hormones that control metabolism, energy levels, and body temperature.
- **Adrenal Glands:** Produce adrenaline and cortisol, which help the body respond to stress.

4. Why is the pituitary gland known as the "master gland"?

The pituitary gland is called the "master gland" because it produces hormones that regulate other glands in the endocrine system and controls various bodily functions, such as growth, blood pressure, and reproduction.

5. What is the role of the pancreas in the endocrine system?

The pancreas produces insulin and glucagon, hormones that help regulate blood sugar levels. Insulin lowers blood sugar by helping cells absorb glucose, while glucagon raises blood sugar by releasing stored glucose.

6. How does the body respond to stress and which gland is responsible?

In response to stress, the adrenal glands release adrenaline and cortisol. Adrenaline prepares the body for "fight-or-flight" by increasing heart rate and energy, while cortisol helps manage stress over a longer period.

7. What hormone does the thyroid gland release, and what is its role?

The thyroid gland releases thyroxine, which plays a role in controlling the body's metabolism, including how fast or slow the body uses energy.
