

# Dreamworld: Physics in Real Life

## Thesis

Physics, when taught in school, is mostly theoretical, but when combined with excursions such as the Dreamworld trip, the real life applications of it become clear, making the trip highly valuable.

## Introduction

The class excursion to Dreamworld has allowed for the consolidation of theoretical notions in a practical environment. Concepts such as conservation of energy, acceleration due to gravity and simple harmonic motion were able to be observed and experienced. Further calculations and reasoning highlighted discrepancies between the practical and theoretical results found. At Dreamworld, an accelerometer was worn on rides to measure the acceleration experienced on board, so that the data could be compared to predictions. Additionally, a clinometer was used to measure angles to determine heights of rides at certain points. These results were found from riding and observing Dreamworld's Giant Drop, Claw and Buzzsaw.

## The Giant Drop

The Giant Drop mainly presented the concept of acceleration due to gravity. Standing at 120m tall according to Dreamworld and calculations (see below: Height of Gondola at Drop Point), the Giant Drop has been hailed as the, "tallest free-falling ride in the world" (Guinness Book of World Records, 1999). Acceleration due to gravity is, "the acceleration of a body due to the influence of the pull of gravity alone," (Universe Today, 2016). As such, it is expected that for the duration of the ride's free-fall it would accelerate at  $9.8\text{m/s/s}$  which is the known acceleration due to gravity on Earth (Universe Today, 2016). During this estimated 2.77 seconds, weightlessness was experienced by riders. Data obtained through use of a clinometer at Dreamworld was first used to calculate the height of the gondola at the ride's drop point then to determine the velocity of the ride throughout.

**Complex Agent-Based Models** Mauro Gallegati, 2018-09-19 This book offers a thorough introduction to the highly promising complex agent based approach to economics in which agent based models ABMs are used to represent economic systems as complex and evolving systems composed of heterogeneous agents of limited rationality who interact with each other generating the system's emergent properties in the process This approach represents a response to the limitations of the dominant theory in economics which does not consider the possibility of a major crisis and to the inability of dynamic stochastic general equilibrium theory to generate empirically falsifiable propositions In the new perspective the focus is on identifying the elements of instability rather than the triggering event As the theory of complexity demonstrates the interactions of heterogeneous agents produce non linearity this puts an end to the age of certainties With ABMs the methodology is from the bottom up The individual parameters and their distribution are estimated and then evaluated to verify whether aggregate regularities emerge on the whole In short not only micro but also meso and macro empirical validation are employed Moreover it shows that the mantra of growth should be supplanted by the concept of a growth Given its depth of coverage the book will enable students at the undergraduate and Master's level to gain a firm grasp of this

important emerging approach This book is flower blossomed by one of the two greatest Italian economists Bruce Greenwald
