

AP Physics 1- Circular Motion and Rotation Practice Problems

FACT: The motion of an object in a circular path at a constant speed is known as uniform circular motion (UCM). Because an object in UCM is constantly changing direction, it is also constantly changing its velocity. This means that an object in UCM is constantly accelerating. This is called centripetal acceleration (a_c).

$$\Delta \mathbf{v} = \mathbf{v}_2 - \mathbf{v}_1$$

$$\Delta \mathbf{v} = \mathbf{v}_2 - \mathbf{v}_1$$

$$\Delta \mathbf{v} = \mathbf{v}_2 - \mathbf{v}_1$$

HERE

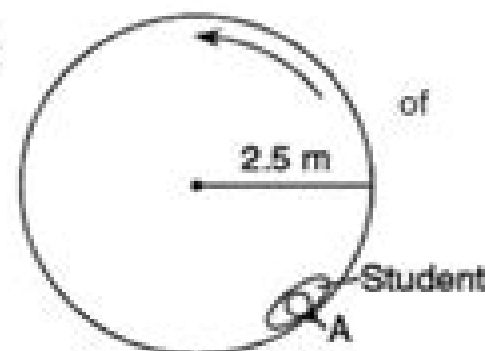

FACT: Recall, that $\vec{a} = \frac{\Delta \mathbf{v}}{\Delta t} = \frac{\mathbf{v}_2 - \mathbf{v}_1}{\Delta t}$, divided by the change in

time. We can show this vectorially in the diagrams to the right. Recall, that when we subtract vectors, we are really adding a negative vector. You can repeat this process around a circle and the acceleration vector will always point toward the center of the circle. Centripetal means "center-seeking".

FACT: Now that we know the direction of the object's acceleration is towards the center, we need to find the magnitude. The formula for the object's centripetal acceleration is: $a_c = \frac{v^2}{r}$. The magnitude of centripetal acceleration clearly depends on the objects velocity (v) and the radius (r) of the circular path. The visual intuition for this idea is described in podcast #7 and it is important to acknowledge that differential calculus is needed for the derivation. However, here is another explanation that does not involve calculus. One rotation takes $2\pi r/v$ units of time (t). And the velocity changes from v to $-v$ and back to v again (total change = $4v$). So acceleration = $\frac{\Delta v}{\Delta t} = \frac{4v^2}{2\pi r}$. Again, podcast #7 provides a visual representation of this explanation.

Q1. The diagram shows the top view of a 65 kg student at a point A on an amusement park ride. The ride spins the student in a horizontal circle of radius 2.5 m, at a constant speed 8.6 m/s. The floor is lowered and the student remains against the wall without falling to the floor. (a) draw the vector for the centripetal acceleration on the diagram (b) Which direction is the force normal? (c) Which direction is the force of friction on the student's body?
