

Fig 2.1.2 Properties of Field Lines, iron filings around the magnet poles

1. Lines of force concentrate more at the ends and spread towards the centre
2. Lines of force never cross each other or split them
3. The poles repel
4. A region where there are more lines is called a 'strong' region and the field is strong and the region where the lines are few is called a 'weak' region and the field is weak

Lines of force of a magnet placed in the magnetic field show the direction of the field lines.

The combined field due to two neighbouring magnets can also be obtained by joining patterns. In figure 2.2, where two like poles are facing each other, the pattern is called a 'repulsive' or 'anti' magnetic field.

Note: If you place two opposite magnets with similar ends close to each other as shown the field between them is called an 'attractive' magnetic field.

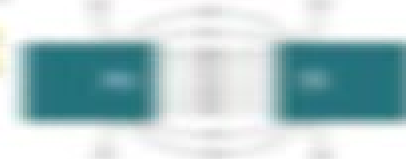

Fig 2.2 Methods of Magnetisation

2.2.1 Induced magnetism

You can magnetise a magnetic material simply by allowing it to be in magnetic field. This means that a magnetic substance can then act as because the magnetic field of the bar magnet magnetises the domains inside the material as shown in the diagram on the right.

Note: A magnetic substance is called a 'ferromagnetic' material if it can be turned up the material becomes a magnet.

2.2.2 Stroking

Stroking the magnet in one direction several times can magnetise the domains.

The previous two methods are able to align the domains of a magnetic material to a few extent and so they don't produce much magnets.
