

CHAPTER 19 ACTIVE READING WORKSHEETS**POPULATIONS****Section 19-3: Human Population Growth**

Read the passage below, which covers topics from your textbook.
Answer the questions that follow.

Today about 20 percent of the world's population live in developed countries. This category includes all of the world's modern, industrialized countries, such as the United States, Japan, Germany, France, the United Kingdom, Australia, Canada, and Russia. On average, people in developed countries are better educated, healthier, and live longer than the rest of the world's population. Population growth rates in developed countries are very low—about 0.003 per capita. The populations of some of these countries, such as Russia, Germany, and Italy, are shrinking because death rates exceed birthrates.

Most people (about 80 percent of the world's population) live in developing countries, a category that includes most countries in Asia, Central America, South America, and Africa. In general, these countries are poorer than the more-developed countries, and their populations are growing much faster—at a growth rate of about 0.015 per capita.

Fill in the blank to complete each sentence.

The Role of Population Games in the Design of Optimization-Based Controllers Julian Barreiro-Gomez, 2018-08-01 This book reports on the implementation of evolutionary game theory in the design of distributed optimization based controllers. First it discusses how the classical population game approach can contribute to and complement the design of optimization based controllers. It shows how the features of this approach can be exploited to extend their capabilities in the solution of distributed optimization problems and examines density games in order to consider multiple coupled constraints and preserve the non centralized information requirements. Furthermore it establishes a close relationship between the possible interactions among agents in a population with constrained information sharing among different local controllers. It also discusses coalitional games focusing on the Shapley power index and proposes an alternative method of computing the latter which reduces computational time as well as a different way of finding it using distributed communication structures. All the proposed strategies are then tested on various control problems such as those related to the Barcelona water supply network, multiple continuous stirred tank reactors, various unmanned aerial vehicle systems and a water distribution system. This thesis examined at the Universitat Politècnica de Catalunya and Universidad de los Andes in 2017 received the award for best thesis in control from the control group of the Spanish Committee of Automatic Control CEA in the same year. **1990**
