**Artificial Intelligence Future Ten Development Stages**

Johnny Ch LOK, 2019-12-03 Nowadays advances in robotics artificial intelligence and machine learning are in a new age of automation as machines match or outperform human performance in a development to any countries For example automation of activities can enable businesses to improve performance by reducing errors and improving quality and speed and in some cases achieving outcomes that go beyond human capabilities For example some research indicated automation could raise productivity growth globally by 0.8 to 1.4 % annually more than 2 000 work activities across 800 occupations When less than 5% of all occupations can be automated using demonstrated technologies about 60% of all occupations have at least 30% of constituent activities that could be automated Many occupations will change that will be automated away Activities most susceptible to automation involve physical activities in highly structured and predictable environments as well as the collection and processing of data They are most prevalent in manufacturing accommodation and food service and retail trade and include some middle skill jobs For example such as natural language processing is a key factor Beyond technical feasibility the cost of technology competition with labor including skills and supply and demand dynamics performance benefits including and beyond labor cost savings and social and regulatory acceptance will be affected by AI automation technology Thus AI automation will impact to influence global employment in those aspects as below Firstly assuming that people are displaced by automation will find other employment The anticipated shift in the activities in the

labor force is of a similar order as the long term shift away from agriculture and decreases in manufacturing share of employment Both of manufacturing and agriculture industries which would be accompanied by the creation of new types of work not foreseen at the time Secondly for business the performance benefits of automation are relatively clear Thus the businessmen have opportunities for their micro economies to benefits from the productivity growth potential and macro economies to benefit to encourage continued progress and innovation investment and market incentives At the same time employers must innovate policies to help workers and institutions adapt to the impact on employment This will likely include rethinking education and training income support and safety nets as well as support for those dislocated when employees need to leave themselves homes to move to other cities to learn new AI automation works Thus individuals in the workplace will need to engage move comprehensively with machines as part of their everyday activities and acquire new skills that will be in demand in the new automation age Consequently the scale of shifts in the labor force over many decades that automation technologies can be a similar order to the long term technology enables shifts in the developed countries workforces away from agriculture in the 21 th century Those shifts did not result in long term mass unemployment because they were accompanied by the creation of new types of work not foreseen at the time However human will still be needed in the workforce when the total productivity gains are caused by AI technology
