Williamson,1999 This thesis presents an approach to robot arm control exploiting natural dynamics The approach consists of using a compliant arm whose joints are controlled with simple non linear oscillators The arm has special actuators which makes it robust to collisions and gives it a smooth compliant motion The oscillators produce rhythmic commands of the joints of the arm and feedback of the joint motions is used to modify the oscillator behavior The oscillators enable the resonant properties of the arm to be exploited to perform a variety of rhythmic and discrete tasks These tasks include tuning into the resonant frequencies of the arm itself juggling turning cranks playing with a Slinky toy sawing wood throwing balls hammering nails and drumming For most of these tasks the controllers at each joint are completely independent being coupled by mechanical coupling through the physical arm of the robot The thesis shows that this mechanical coupling allows the oscillators to automatically adjust their commands to be appropriate for the arm dynamics and the task This coordination is robust to large changes in the oscillator parameters and large changes in the dynamic properties of the arm As well as providing a wealth of experimental data to support this approach the thesis also provides a range of analysis tools both approximate and exact

These can be used to understand and predict the behavior of current implementations and design new ones These analysis techniques improve the value of oscillator solutions The results in the thesis suggest that the general approach of exploiting natural dynamics is a powerful method for obtaining coordinated dynamic behavior of robot arms The British National
