

Working of Firewall as a Service security technology

This slide illustrates the working of Firewall as a service technology. The purpose of this slide is to outline various actions performed by Firewall such as Intrusion Prevention Systems, DNS security, etc. Main components include accept, drop and block.

Positioned between corporate network and the public internet

Defend company's architecture from cyberattacks by blocking incoming threats from entering network using a variety of filtering and security mechanisms

Actions include -

- Intrusion prevention systems (IPS)
- Complete event recording
- Automatic actions in reaction to threat detection
- Domain Name System (DNS) security

Examine each block of data packets entering or leaving the internet or the host computer

Consider three options depending on a set of security guidelines

- Accept: Permit the transmission of data packets
- Drop: Data packets are stopped if they do not obtain a response
- Block: Reject packet data and alert the source of a "reachable error" upon rejecting
