

LAB 5-1: SEQUENCE OF EVENTS

INTRODUCTION: The geologist works to develop a model of Earth's history and attempts to put events in order of what happened first, what second, and so on. When the relative age of a rock or event is determined, this information can be diagramed as a cross-section showing the vertical distribution of geologic rock units.

This lab will not consider the actual or absolute age in which an event occurred or when the rock was formed.

OBJECTIVE: Using cross-sections you will infer a logical sequence of geologic events and establish a probable relative age for a series of rock layers.

VOCABULARY:

relative age: The age of a rock compared to the ages of other rocks.

unconformity: A break in the geologic record created when rock layers are eroded or when sediment is not deposited for a long period of time.

erosional surface: A flat or nearly flat surface that has been made by erosion.

subsidence: A depression of land surface as a result of erosion.

uplift: A depression of land surface as a result of erosion.

emergence: Process of coming into being.

submergence: Sinking caused by erosion.

uniformitarianism: Geologic process that operate in the past to C.

Change Earth's Surface

superposition: in a vertical sequence of rock layers oldest to Y.

original horizontality: Sedimentary rocks are always formed in flat

PROCEDURE:

1. For each of the geologic cross-sections determine the relative ages of the rock units and other features labeled with letters.
2. List the sequence of events by writing the letters from oldest (first) to youngest (latest) in the spaces under "Events" provided in the Report Sheet.
3. Include any erosion, emergences, and submergences that occurred. Use the following abbreviations: ER = erosion; EM = emergence; SU = submergence.
4. Write a description of the events listed under "Description" on the Report Sheet.
