

## 5. Projectile Motion

### Study Design

- investigate and analyse theoretically and practically the motion of projectiles near Earth's surface, including a qualitative description of the effects of air resistance

### Introduction

A projectile is a body that has been thrown or projected, and is travelling freely through the air. While undergoing projectile motion the object is under the constant unbalanced force of gravity. When we study projectile motion, no consideration is given to the force projecting the body or to what happens when it lands. Air resistance is considered to be negligible (in quantitative questions), but can be taken into consideration in qualitative questions. The projectile will travel either: vertically or inclined, depending on the initial angle of projection.

The vertical and horizontal motions are treated independently. Usually the vertical motion is treated first, since it determines how long the projectile is in the air.

#### For both the vertical and inclined projectiles:

- the only force acting is the weight, ie. the bodies are in free fall
- acceleration is **always**  $9.8 \text{ ms}^{-2}$  downward, (including the point C)
- the instantaneous velocity is tangential to the path
- the total energy (KE & PE) is constant
- between any two points  $\Delta KE = -\Delta PE$
- paths are symmetrical for time eg.  $\Delta t \text{ (A to B)} = \Delta t \text{ (D to E)}$ ;  
 $\Delta t \text{ (A to C)} = \Delta t \text{ (C to E)}$
- paths are symmetrical for speed eg. speed at A = speed at E; speed at B = speed at D.
- for vertical motion  $v_c = 0$ , for inclined motion  $v_c \neq 0$ .

#### Inclined or oblique projections

- the only force acting is vertically down, so the acceleration and change in velocity are vertical.
- horizontally there is no component of force, so constant horizontal velocity.
- Maximum range is when angle of projection is  $45^\circ$

expanding and improving on the equipment They even developed a system of quantification where points were given for the degree of difficulty of an ascent This system focused primarily on the pitch of the mountain and it even calculated up to decimals to give a high degree of quantification Rock climbing became a technical system Csikszentmihaly 1976 observed that the sole interest of rock climbers at that time was to climb the rock Rock climbers were known to reach the top and not even glance around at the scenery The focus was on reaching the top of the rock In contrast mountaineers saw the whole mountain as a single unit of perception The ascent to them is a gestalt including the aesthetic historical personal and physical sensations Csikszentmihaly 1976 p 486 This is an example of two contrasting approaches to the same kind of landscape and of two different groups of people Interestingly in the US Europe and Japan a large segment of the early rock climbers were young mathematicians and theoretical physicists while the mountaineers were a more varied lot
