Toward a Better Understanding of Rule-Breaking Market Behavior Ann-Kathrin Veenendaal, 2019-07-15 This book analyzes how companies and employees can endogenously i.e. without hiring external experts or consultants achieve competitive advantages by deviating from behavioral standards in a productive way The study explores eight transformative behavioral innovations that shaped the development of sports and by analogy uses the findings to advance solutions for prevalent problems in business By developing triggers to creativity and applying mechanisms on how to overcome innovation resistance the book gives concrete advice on how to manage the difficult quest of human transformation beyond the imperative of technological innovation

psychology are just surface symptoms whereas fundamental problems e.g. the inappropriateness of statistical assumptions for psychical phenomena and the actual root causes underlying psychology's crises and disputes around its scientific status are still hardly addressed. With this Research Topic we want to give new impetus to critical debates on the epistemological and methodological foundations of quantitative methods and measurement in psychology including problems long known but still hardly considered. Examples are: The behavioural and psychical phenomena's non-ergodicity rendering sample level statistics uninformative about individual level phenomena; Psychometricians' alignment of results to statistical theories rather than to features of the study phenomena biasing inferences on the latter; Ideas that laypeople's intuitive judgements could reveal quantitative structures in complex largely unobservable phenomena; The still unsupported claim that psychical phenomena could have quantitative properties at all and could thus be measured; The fact that psychometric structures shown for verbal item judgements can also be produced by semantic and Artificial Intelligence (AI) algorithms e.g. ChatGPT without collecting any empirical data. Still most quantitative psychologists seem fairly unconcerned about the strong reliance on everyday language e.g. in ratings scales and the imprecise concepts of psychological measurement perhaps because their consequences do not become as straightforwardly apparent as in other disciplines such as in physics, chemistry and medicine where imprecise measurement can entail the collapse of buildings, chemical explosions or drug overdoses. But where does the loose jargon around measurement variables and psychometrics go seriously wrong in psychology? These and further contradictions, problems and challenges underlying established quantitative practices in psychology must be addressed to tackle the discipline's continued crises and to develop new approaches that are needed to advance psychology as a science. We invite from all fields contributions that critically explore and open up new perspectives on the foundations of quantification and measurement in psychology including perspectives still hardly considered e.g. qualitative mathematics, complex dynamic systems, fuzzy systems, modelling, machine learning. We are also interested in methods for generating quantitative data either executed by persons e.g. time based observations, computer based coding or by automated technology e.g. ecological momentary monitoring, life logging, reality mining. However, other than commonly done we are explicitly not seeking proposals for improving specific techniques of data analysis e.g. statistical or latent variable models. Instead, our focus is on making explicit and scrutinising the implicitly underlying rationales and fundamental principles, thus the theory, philosophy and methodology on which quantitative research in psychology currently is or should be built in the future. This also includes critical views on whether or not quantitative investigations are meaningful at all for a science exploring behaviour, mind and society and thus also contributions to the psychology, sociology and philosophy of science in this field.
