Chapter 1: About Science

Answers to Chapter 1 Review Questions

1. The era of modern science in the 16th century was launched when Galileo Galilei revised the Copernican view of the heliocentric universe, using experiments to study nature's behavior.
2. In *Conceptual Integrated Science*, we believe that focusing on math too early is a poor substitute for concepts.
3. We reason that it must be capable of being proved wrong.
4. Nonscientific hypotheses must be perfectly reasonable; they are nonscientific only because they are not falsifiable—there is no test for possible wrongness.
5. Galileo showed the fallacious of Aristotle's claim with a single experiment—dropping heavy and light objects from the Leaning Tower of Pisa.
6. A scientific fact is something that competent observers can observe and agree to be true; a hypothesis is an explanation or answer that is capable of being proved wrong; a law is a hypothesis that has been tested over and over and not contradicted; a theory is a synthesis of facts and well-tested hypotheses.
7. In everyday speech, a theory is the same as a hypothesis—a statement that hasn't been tested.
8. Theories grow stronger and more precise as they evolve to include new information.
9. The term *supernatural* literally means "above nature." Science works within nature, not above it.
10. They rely on subjective personal experience and do not lead to testable hypotheses. They lie outside the realm of science.
11. Science, art, and religion can work very well together, like strings on a guitar, when played together, the chord they produce can be a chord of profound richness.
12. Science is concerned with gathering knowledge and organizing it. Technology lets humans use that knowledge for practical purposes, and it provides the instruments scientists need to conduct their investigations.
13. Chemistry builds on physics by telling us how matter is put together, how atoms combine to form molecules, and how the molecules combine to make the materials around us. Biology is more complex than physical science (physics and chemistry), because it involves matter that is alive and, therefore, engaged in complex biochemical processes.
14. Integrated science is valuable because the real-life phenomena we are interested in typically involve principles from more than one branch of science; put another way, we study integrated science because the world is integrated.

Answers to Chapter 1 Integrated Science Concepts

Chemistry and Biology: An Investigation of Sea Butterflies

1. The disciplines of biology and chemistry are needed to understand the behavior of the Antarctic amphipod.
2. The control used in the investigation was the pollens fed to the predator fish that were not treated with sea-butterfly extracts. The control was needed to see whether the chemical deterrent isolated from the sea butterfly deterred the predator fish.
3. McCosker and Baker's hypothesis was that amphipods carry sea butterflies because sea butterflies produce a chemical that deters a predator of the amphipod. This is a scientific hypothesis because it would be proven wrong if the secreted chemical were found to not deter amphipod predators.

Critical Debates on Quantitative Psychology and Measurement: Revived and Novel Perspectives on Fundamental Problems Jana Uher, Jan Ketil Arnulf, Barbara Hanfstaengl, 2025-11-14 Psychology's continued crises in replicability validity generalisability and thus confidence in its findings are currently attributed primarily to questionable research practices QRPs e.g. p-hacking HARKing cherry-picking Popular pertinent debates therefore centre on proposals for remedying inappropriate method applications e.g. larger samples robust statistics pre-registration replication Replicable non-random effects of psychological interventions and differentiations between individuals are essential for applied purposes But current approaches to replicability validity and psychometric modelling are merely pragmatic providing evidence of just utility to discriminate well and consistently between cases and in ways considered important e.g. social relevance relations to future outcomes Yet without understanding the study phenomena in themselves e.g. individuals' experience beliefs thought processes and without elaborating how relevant features of them can be made amenable to quantitative investigation and if at all the quantity objection the actual causes of replicable quantitative findings cannot be explored These causes however may be completely unrelated to the actual study phenomena e.g. methodomorphism This concerns in particular the attributes and latent constructs studied in psychology given that these are theoretical and statistical concepts that are attributed and construed as means of investigation and that only refer to but do not constitute the actual study phenomena in themselves We believe the currently debated deficiencies of quantitative practices in psychology are just surface symptoms whereas fundamental problems e.g. the inappropriateness of statistical assumptions for psychical phenomena and the actual root causes underlying psychology's crises and disputes around its scientific status are still hardly addressed With this Research Topic we want to give new impetus to critical debates on the

epistemological and methodological foundations of quantitative methods and measurement in psychology including problems long known but still hardly considered Examples are The behavioural and psychical phenomena s non ergodicity rendering sample level statistics uninformative about individual level phenomena Psychometricians alignment of results to statistical theories rather than to features of the study phenomena biasing inferences on the latter Ideas that laypeople s intuitive judgements could reveal quantitative structures in complex largely unobservable phenomena The still unsupported claim that psychical phenomena could have quantitative properties at all and could thus be measured The fact that psychometric structures shown for verbal item judgements can also be produced by semantic and Artificial Intelligence AI algorithms e g ChatGPT without collecting any empirical data Still most quantitative psychologists seem fairly unconcerned about the strong reliance on everyday language e g in ratings scales and the imprecise concepts of psychological measurement perhaps because their consequences do not become as straightforwardly apparent as in other disciplines such as in physics chemistry and medicine where imprecise measurement can entail the collapse of buildings chemical explosions or drug overdoses But where does the loose jargon around measurement variables and psychometrics go seriously wrong in psychology These and further contradictions problems and challenges underlying established quantitative practices in psychology must be addressed to tackle the discipline s continued crises and to develop new approaches that are needed to advance psychology as a science We invite from all fields contributions that critically explore and open up new perspectives on the foundations of quantification and measurement in psychology including perspectives still hardly considered e g qualitative mathematics complex dynamic systems fuzzy systems modelling machine learning We are also interested in methods for generating quantitative data either executed by persons e g time based observations computer based coding or by automated technology e g ecological momentary monitoring life logging reality mining However other than commonly done we are explicitly not seeking proposals for improving specific techniques of data analysis e g statistical or latent variable models Instead our focus is on making explicit and scrutinising the implicitly underlying rationales and fundamental principles thus the theory philosophy and methodology on which quantitative research in psychology currently is or should be built in the future This also includes critical views on whether or not quantitative investigations are meaningful at all for a science exploring behaviour mind and society and thus also contributions to the psychology sociology and philosophy of science in this field
