

## Chapter 11 Introduction to Genetics

## Section Review 11-1

## Reviewing Key Concepts

**Short Answer** On the lines provided, answer the following questions.

1. State Mendel's principle of dominance.

Mendel's principle of dominance states that some alleles are dominant + others are recessive.

2. Which two combinations of alleles could produce a trait controlled by a dominant allele?

A + trait if there are 2 dominant or 1 dominant + 1 recessive alleles present.

3. What combination of alleles could produce a trait controlled by a recessive allele?

A + trait only controlled by a recessive allele will be produced only when 2 recessive alleles are present.

4. Explain segregation of alleles, using pea plant traits in your example.

Segregation is the process during gamete formation in which the two alleles are separated from each other so that each gamete carries only a single copy of each gene.

## Reviewing Key Skills

5. **Applying Concepts** Explain how Mendel's experiments would have been different if he had not worked with true-breeding plants.

True breeding plants allowed Mendel to pinpoint the cause of variation in traits b/c he could control which plants bred. w/o true-breeding plants, Mendel would not have been able to draw his conclusion b/c there would be too many variables.

6. **Comparing and Contrasting** Explain the difference between cross-pollination and self-pollination in plants.

Cross-pollination is the process of one plant fertilizing another, while self-pollination occurs when a plant fertilizes itself.

7. **Calculating** One fourth of the plants resulting from a certain cross are expected to show a trait controlled by a recessive allele. If 675 plants resulting from the cross display a trait controlled by a dominant allele, how many plants will show the trait controlled by the recessive allele?

225 plants will show the trait controlled by the recessive allele.

8. **Applying Concepts** If one of the plants used in the  $F_1$  cross had  $TT$  alleles and was combined with a plant with  $Tt$  alleles, would the trait controlled by the recessive allele have been produced in the resulting  $F_2$  generation? Explain your answer.

The trait controlled by the recessive allele would not have been produced in the resulting  $F_2$  generation. Both  $F_1$  generation plants need to have  $Tt$  allele combinations for the trait controlled by the recessive allele to be produced in one of the  $F_2$  generation plants.

**Efficient and Accurate Parallel Genetic Algorithms** Erick

Cantú-Paz, 2012-12-06 As genetic algorithms GAs become increasingly popular they are applied to difficult problems that may require considerable computations In such cases parallel implementations of GAs become necessary to reach high quality solutions in reasonable times But even though their mechanics are simple parallel GAs are complex non linear algorithms that are controlled by many parameters which are not well understood *Efficient and Accurate Parallel Genetic Algorithms* is about the design of parallel GAs It presents theoretical developments that improve our understanding of the effect of the algorithm s parameters on its search for quality and efficiency These developments are used to formulate guidelines on how to choose the parameter values that minimize the execution time while consistently reaching solutions of high quality *Efficient and Accurate Parallel Genetic Algorithms* can be read in several ways depending on the readers interests and their previous knowledge about these algorithms Newcomers to the field will find the background material in each chapter useful to become acquainted with previous work and to understand the problems that must be faced to design efficient and reliable algorithms Potential users of parallel GAs that may have doubts about their practicality or reliability may be more confident after reading this book and understanding the algorithms better Those who are ready to try a parallel GA on their applications may choose to skim through the background material and use the results directly without following the derivations in detail These readers will find that using the results can help them to choose the type of parallel GA that best suits their needs without having to invest the time to implement and test various options Once that is settled even the most experienced users dread the long and frustrating experience of configuring their algorithms by trial and error The guidelines contained herein will shorten dramatically the time spent tweaking the algorithm although some experimentation may still be needed for fine tuning *Efficient and Accurate Parallel Genetic Algorithms* is suitable as a secondary text for a graduate level course and as a reference for researchers and practitioners in industry
