

NERVOUS SYSTEM

There are two regulatory systems in our body. These are *nervous system* and *endocrine system*. Nervous system is found only in animals. Plants don't have nervous system but endocrine system is found both plants and animals.

The human nervous system is made up of *brain*, *spinal cord* and *nerves*. The nervous system is your body's control system. It sends, receives and processes message throughout the body. These messages tell your muscles and organs what to do and how to respond to the environment. The environment of an organism is always changing. Some of these take place in the external environment that is outside of the body.

Organisms require systems to maintain internal balance (**homeostasis**) and the normal function of the bodies. Stable internal conditions; balanced internal conditions

Ex: Temp. = 36, 5 °C blood pressure = 120 – 80 blood pH = ~7

- We become aware of our environment and give reactions to internal and external changes by the help of our nervous system.
- The nervous system is specific for animals. There is no nervous system formation in plants.
- The nervous system controls all of the activities of the body. It is made up of neurons. **Neurons**, special cells of the nervous system, transmit information rapidly.
- The nervous system coordinates and regulates body functions. The five senses provide information on changes in the external environment.
- A stimulus is a change in the environment. All the stimuli are received by the sensory organs and transmitted to the nerve centers in the nervous system and interpreted. According to the stimuli, proper reaction is ordered by the nerve centers.

Mechanisms of Nervous Regulation:

The functioning of a nervous system involves three basic types of structures.

1- Receptors

2- Nerve cells

3 - Effectors

- **Receptors**, or sense organs, are specialized structures that are sensitive to certain changes, physical forces, or chemicals in the internal and external environments.
- Stimulation of a receptor causes "messages," or impulses, to be transmitted over a pathway of **nerve cells**.
- **Effector**, which is either a gland or a muscle.
- If the effector is a gland, it will respond to the impulse by either decreasing or increasing its activity.
- If the effector is a muscle, a nerve impulse can only cause it to contract.

Response: your nervous system (=in this case brain) orders locomotion system (in (=in this case muscles) not to move and you stay in bed. All above stages are performed in the nervous system.

Neuron

The basic unit structure of the nervous systems is the nerve cell, or neuron.
