

## Unit: Electricity

### Ch1: Electrostatics

#### 1. Definition

**Electrostatics:** is the study of electric charges at rest.

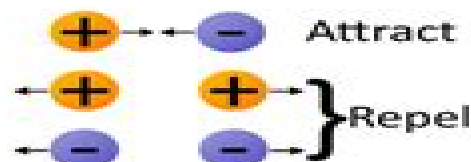

Electrostatic phenomena arise from the forces that electric charges exert on each other. Such forces are described by Coulomb's law.

#### 2. Overview

- Everything has electric charges, both positive (protons), and negative (electrons).
  - Usually, objects have an equal number of positive and negative charges, therefore they are neutral.
  - If an object loses electrons, it will become positively charged object.
  - If an object gain electrons, it will become negatively charged object.
- Only electrons (-) move, but protons (+) do not move.

**Law of Electric Charges:**

- Unlike charges attract each other.
- Like charges repel each other.

**Total Charge (Q) of a body:**

If an object has an excess or deficit of N electrons, its total charge is given by:

$|Q| = N \times e$ , where e is charge of one electron;  $e = 1.6 \times 10^{-19} \text{C}$ .

**Example1:**

Consider a body containing  $5.2 \times 10^5$  electrons. Calculate the total charge of the body.

#### 3. Types of Electrification

**Electrification:** is the process of charging objects by adding or removing electrons.

- Electrification (Charging) by friction.
- Electrification (Charging) by contact (conduction).
- Electrification (Charging) by induction.
