1 Introduction

Last year's review on magnetism in the Annual Reports was the first for several years, and it indulged in an introduction to developments in solid-state magnetism throughout the second half of the 1980's. This year, I shall constrain myself to work published in 1991 or late in 1990 and greatly reduce the amount of background material. The scope and format of the article remains the same. Work on pure metallic elements and intermetallic alloys will be omitted despite healthy activity in the field of heavy-fermion materials.¹ Thin-films – be they metals,^{2–6} superconductors,⁷ charge-transfer salts⁸ or oxides^{9–11} – are important technological materials. They also provide opportunities to control and study the microscopic nature of magnetism through the deposition of atomic layers on a variety of substrates with molecular beam epitaxy. Nevertheless, I shall leave the reader to consult recent reviews.¹² The unusual properties of very small magnetic particles, both metallic^{13–16} and insulating,^{17,18} are exciting much interest but once more I leave the reader with key references. I shall continue my policy of ignoring measurements which are part of the routine characterization of a material unless they illuminate some aspects of magnetism. As before, this review is biased in favour of insulating magnets that show cooperative magnetic properties through the influence of superexchange.
