**Unit 3 Cellular Energetics**  
**Module 17 Cellular Respiration I: Overview**

**17.1 Cellular respiration harnesses energy of carbohydrates and other fuel molecules**

**1. Define cellular respiration.**

series of chemical reactions in which organic molecules are oxidized to carbon dioxide, converting the energy stored in organic molecules to ATP

**2. Discuss the importance of converting organic molecules into ATP.**

can be used to power many of the chemical reactions that occur all of the time in cells

**3. Differentiate aerobic respiration from anaerobic respiration.**

Cellular respiration that occurs in the presence of oxygen is known as aerobic respiration. Cellular respiration that occurs in the absence of oxygen is known as anaerobic respiration

**4. Write the reaction for cellular respiration.**

**5. Write a description using words of the equation for cellular respiration.**

in cellular respiration, glucose is oxidized to carbon dioxide, and, at the same time, oxygen is reduced to water

**6. Explain how the cellular respiration reaction provides energy.**

Cellular respiration releases a large amount of free energy — energy available to do work — because the sum of the potential energy in all of the chemical bonds of the reactants (glucose and oxygen) is higher than that of the products (carbon dioxide and water).

**7. Identify the maximum amount of free energy released during cellular respiration.**

The maximum amount of free energy released during cellular respiration is  $-686$  kcal per mole of glucose
