

Figure 3. Distribution of lymphatic vessels and lymph nodes

#### LYMPHATIC VESSELS

- Similar to veins of the cardiovascular system
  - Thin walled
  - Larger vessels have valves
  - Low-pressure, pumpless system
- **Lymph transport is aided by:**
  - Milking action of skeletal muscles (like how skeletal muscles can open valves of veins when it is squeezed by the muscles)
  - Pressure changes in thorax during breathing
  - Smooth muscles in walls of lymphatics

#### LYMPH NODES

- Lymph nodes help protect the body by removing foreign material such as bacteria and tumor cells from the lymphatic stream by producing **lymphocytes** that function in the immune response
- Lymph nodes filter lymph before it is returned to the blood
  - As lymph is transported toward the heart, it is filtered through the thousands of lymph nodes that cluster along the lymphatic vessels
- Large clusters are found in the **inguinal, axillary, and cervical** regions of the body
- **Harmful materials that are filtered:**
  - Bacteria
  - Viruses
  - Cancer Cells
  - Cell debris
- **Defense cells within lymph nodes:**
  - **Macrophages** – engulf and destroy bacteria, viruses, and other foreign substances in the lymph before it is returned to the blood
  - **Lymphocytes** – respond to foreign substances in the lymphatic stream
- **Lymph nodes** vary in shape and size but most are **kidney-shaped**, less than 1 inch long, and buried in connective tissue

- Each node is surrounded by a **fibrous capsule** from which connective tissue strands called **trabeculae**
  - Divided into compartments by **trabeculae**

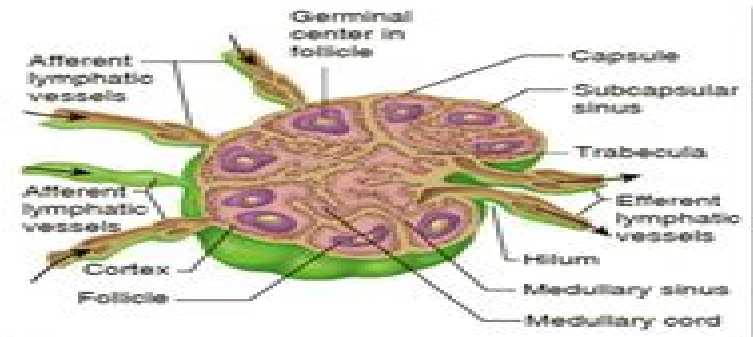

Figure 4. Structure of a lymph node

- Internal framework is a network of **soft reticular connective tissue**
- **Lymphocytes** arise from the redbone marrow but then migrate to the lymph nodes and other lymphoid organs, where they reproduce further
- The **cortex** (outer part) contains collections of lymphocytes called **follicles**
  - **Follicles** – collections of lymphocytes, many of which have **dark-staining** centers called **germinal centers**
  - Germinal centers enlarge when specific B lymphocytes (the B cells) are generating daughter cells **plasma cells** which release antibodies.
  - **T-cells** – the rest of the cortical cells that are in transit
    - Circulate continuously between the blood, lymph nodes, and lymphatic stream
- **Medulla** (inner part)
  - The **medullary cords** are inward extensions of cortical tissue that contain both B and T cells
  - **Phagocytic macrophages** are located in the central medulla of the lymph node

#### FLOW OF LYMPH THROUGH NODES

1. Lymph enters the convex side through **afferent lymphatic vessels**
2. Lymph flows through a number of sinuses or spaces inside the node
3. Lymph exits through **efferent lymphatic vessels** because there are fewer efferent than afferent vessels, flow is **slowed**
  - It allows time for the lymphocytes and macrophages to perform their protective functions
