LabNet--toward a Community of Practice Richard Ruopp,1993 First Published in 1992 Routledge is an imprint of Taylor Francis an informa company **Progressing Science Education** Keith S. Taber,2009-05-29 Exploring one of the central themes in science education theory this volume examines how science education can be considered as a scientific activity within a broad post positivist notion of science Many students find learning science extremely problematic whatever level of education they have reached At the end of the 1970s a new approach to tackling learning difficulties in science was developed drawing on ideas from psychology and cognitive science and centred on the way students build up new knowledge in reference to their existing ideas Constructivism became the dominant paradigm in science education research for two decades spawning a vast body of literature reporting aspects of learners ideas in different science topics However Constructivism came under fire as it was recognised that the research did not offer immediate and simple prescriptions for effective science teaching The whole approach was widely criticised in particular by those who saw it as having anti science leanings In this book the notion of scientific research programmes is used to understand the development limitations and potential of constructivism It is shown that constructivist work in science education fits into a coherent programme exploring the contingencies of learning science The author goes further to address criticisms of constructivism evaluate progress in the field and suggest directions for future research It is concluded that constructivism has provided the foundations for a progressive research programme that continues to guide enquiry into learning and teaching science **Cumulated Index Medicus** ,1997 Computer Supported Collaborative Learning Claire O'Malley,2012-12-06 Although research in collaborative learning has a fairly long history dating back at least to the early work of Piaget and Vygotsky it is only recently that workers have begun to apply some of its findings to the design of computer based learning systems The early generation of the le systems focused on their potential for supporting individual learning learning could be self paced teaching could be adapted to individual learners needs This was certainly the promise of the later generation of intelligent tutoring systems However this promise has yet to be realised Not only are there still some very difficult research problems to solve in providing adaptive learning systems but there are also some very real practical constraints on the widespread take up of individualised computer based instruction Reseachers soon began to realise that the organisational cultural and social contexts of the classroom have to be taken into account in designing systems to promote effective learning Much of the work that goes on in classrooms is collaborative whether by design or not Teachers also need to be able to adapt the technology to their varying needs Developments in technology such as networking have also contributed to changes in the way in which computers may be envisaged to support learning In September 1989 a group of researchers met in Maratea Italy for a NATO sponsored workshop on Computer supported collaborative learning A total of 20 researchers from Europe Belgium
