

## Biology 12 Genetics Review

1. Why was Mendel's choice of pea plants for studying inheritance such a good one?

Because of their short generation time. And they're cheap.

2. What is the Law of Segregation? What observations lead to Mendel developing this idea?

States that when gametes (sex cells) are formed, the two versions of each gene that the organism has will separate into different sex cells. Mendel thought of this after the recessive trait, that had disappeared in the  $F_1$  generation reappeared in the  $F_2$ . This means the  $F_1$  plants had the recessive gene, but it was "hidden" by the dominant.

3. Although Mendel had described alleles as either dominant or recessive, that idea isn't quite complete. Explain.

At times there is neither a dominant nor recessive version of a gene. Rather they are both codominant or incompletely dominant.

4. What does the term "true-breeding" mean?

It's the old term for homozygous (either recessive or dominant).

5. Mendel did studies on  $P$ ,  $F_1$ , and  $F_2$  generations, it was the  $F_2$  generation that was the most important. Why is that?

The  $F_2$  is where the recessive traits reappeared. This showed that the recessive version was in the previous generation, just hidden by the dominant.

6. If  $T$  represented tall – the dominant allele for stem length, and  $t$  represented short – the recessive allele for stem length, show through a Punnett Square the possible offspring from a cross of a heterozygous tall plant and a homozygous short plant.

	$T$	$t$
$t$	$Tt$	$tt$
$t$	$Tt$	$tt$

7. What is the phenotypic ratio and genotypic ratio for the cross above?

1:1 (tall : short), and 1:1 (homozygous recessive : heterozygous)

8. What is the difference between a one factor cross and a two factor cross? How did these lead to the development of the Laws of Independent Assortment and Segregation?

A one factor cross looks at one characteristic (like plant height) whereas a two factor looks at two characteristics (like plant height and flower colour). The

**Evolutionary and Metaheuristic Techniques** Jayaraman Valadi, Krishna Pratap Singh, Muneendra Ojha, Patrick Siarry, 2024-04-22 This book delves into practical implementation of evolutionary and metaheuristic algorithms to advance the capacity of machine learning. The readers can gain insight into the capabilities of data driven evolutionary optimization in materials mechanics and optimize your learning algorithms for maximum efficiency. Or unlock the strategies behind hyperparameter optimization to enhance your transfer learning algorithms yielding remarkable outcomes. Or embark on an illuminating journey through evolutionary techniques designed for constructing deep learning frameworks. The book also introduces an intelligent RPL attack detection system tailored for IoT networks. Explore a promising avenue of optimization by fusing Particle Swarm Optimization with Reinforcement Learning. It uncovers the indispensable role of metaheuristics in supervised machine learning algorithms. Ultimately this book bridges the realms of evolutionary dynamic optimization and machine learning paving the way for pioneering innovations in the field.
