

Fluid Mechanics: Archimedes' Principle

Boat Float

Purpose

In this experiment, you will investigate Archimedes' Principle and the principle of flotation.

Required Equipment and Supplies

spring scale
string and masking tape
600-ml. beaker
clear container or 3-gallon bucket
chunk of wood
toy boat capable of carrying a 1200-gram cargo, or 9-inch aluminum cake pan

100-g mass
triple-beam balance
rock or hook mass
500-ml. graduated cylinder
water
modeling clay
3 lead masses or lead fishing weights

DISCUSSION: Talk about what I learned: A clay 3 float and 3 sink what's the difference?

Discussion

An object submerged in water takes up space and pushes water out of the way. We say the water is displaced. Interestingly enough, the water that is pushed out of the way pushes back on the submerged object. For example, if the object pushes a volume of water with a weight of 100 N out of its way, then the water reacts by pushing back on the object with a force of 100 N—Newton's third law. We say that the object is buoyed upward with a force of 100 N. This is summed up in Archimedes' principle, which states that the buoyant force that acts on any completely or partially submerged object is equal to the weight of the fluid the object displaces.

Procedure

Step 1: Use a spring scale to determine the weight of an object (rock or hook mass) that is first out of water and then under water. The difference in weights is the buoyant force. Record.

Weight of object out of water = 250 g

Weight of object in water = 200 g

Buoyant force on object = 50 g

Alum
200 g
50 g
50 g

Step 2: Devise a method to find the volume of water displaced by the object. Record the volume of water displaced. Compute the mass and weight of this water. (Remember, 1 mL of water has a mass of 1 g and a weight of 0.01 N.)

Volume of water displaced = 600 N

Mass of water displaced = 600 N

Weight of water displaced = 6 N

25 g weight 0.01 N
