4. Write a paragraph explaining how energy flows through an ecosystem using the following terms: energy pyramid, trophic level, producer, consumer, decomposer
An energy pyramid shows how energy moves through an ecosystem. The sun is the source of all energy on Earth. The sun provides energy needed for the bottom of the energy pyramid: produces. Producers or autotrophs are plants that which harness much of the sun’s energy to make their own food. As we move up the energy pyramid, much of the sun’s energy is lost and only 10% of energy is transferred to each trophic level. The primary consumer is an herbivore or omnivore that eats the producers. Next is the secondary consumer, a carnivore or omnivore that eat the primary consumers. Tertiary or top consumers eat the secondary consumers.

shifts in ecological interactions In this dissertation I present work that asks these kinds of questions as they relate to plants insects and their relationships In chapter one I use a Bayesian hierarchical modeling approach to examine how fruiting and seed dispersal phenology is influenced by climate across the subalpine wildflower community on Mt Rainier I find that the kinds of changes we expect to occur in snowmelt timing temperature and soil moisture are likely to shorten the time it takes for plants to transition from flowering to seed dispersal This work highlights the importance of increased attention on post flowering phases of plant reproductive phenology and suggests that the future may shift relationships between plants and their animal associates including frugivores and invertebrate seed predators In chapter two I ask how the interaction between an ecologically important species subalpine lupine *Lupinus latifolius* var *subalpinus* and its primary insect herbivore the Cascade grasshopper *Prumnacris rainierensis* changes with elevation and use a combination of observations experiments and trait measurements to tease apart the drivers of these patterns The results of this chapter show that grasshopper herbivory has meaningful impacts on lupines and that the strength of this relationship increases with elevation due to a complex suite of interactions between abiotic factors and plant and insect traits that influence levels of consumption These findings point to the difficulty of predicting how species interactions will change in systems where warming is not the sole variable of interest and where climatic history shapes populations responses to environmental change Finally in chapter three I take a meta analytic approach to test the hypothesis that ecological restoration is an effective means of invertebrate conservation using a dataset comprising 59 studies of restoration impacts on invertebrate biodiversity with a wide geographic and taxonomic scope On average I find that the restoration of native vegetation is associated with significant increases in species richness abundance and diversity However high among study heterogeneity suggests an urgent need for more research on neglected taxa habitats and geographic regions more careful study design and reporting and a move toward sharing raw data from restorations assessments Overall this work makes novel contributions to our knowledge about biotic responses to climate change from the perspective of plants and insects and underscores the fundamental complexity of ecological dynamics
