Europass Supporting Semantic Interoperability

Europass promotes semantic interoperability by defining a specific vocabulary according to which the information contained in Europass Documents is expressed. This vocabulary is defined according to an XML schema, which describes the constraints on the structure and on the contents of Europass Documents.

Individuals, who use the Europass Online Editors to produce their Europass Curriculum Vitae or Europass Language Passport, have the option to receive the document in Europass XML format or PDF format with the XML attached. The most important benefit of this option is that it allows individuals to reuse their personal data and save time and effort when accessing the Europass online editors at a later point, or other systems (job portals, employment /admission services, etc.) that "understand" the Europass vocabulary.

Europass XML Vocabulary

The Europass XML Vocabulary is considered to be relatively simple, clear and self-explaining, while remaining sound and extensible, and also as close as possible to other related vocabularies, as those defined by HR-XML.

This document provides a description of the latest version of the Europass XML Schema (v3.4.0) with the aim to support interested parties, who wish to manage, edit or store Europass documents within their information systems.

Structure of this Document

The document is structured as follows: First, an extensive reference to the changes and revisions from the previous version (v3.3.0) is attempted (part 1). Then, we begin the documentation of the latest version by listing the various imported and included XML Schemas, and explain that purpose each schema serves (Part 2). The main body of the document provides an in-depth description of each possible element of a Europass XML document. The order according to which the elements are described matches the hierarchy of the XML document, and starts with the root element of the XML. Each element of the Europass XML is described in detail, by emphasizing the allowed data type and providing an indicative example (Part 3). Finally, the XML data types that are either abstract, or generic or used to define multiple elements are described in detailed in a separate section, and referenced

number of documents stored electronically presents a challenge for automatic classification of documents Traditional classification systems consider documents as a plain text however documents are becoming more and more structured For example XML is the most known and used standard for structured document representation These documents include supplementary information on content organization represented by different elements such as title section caption etc We propose an approach on structured document classification based on both document logical structure and its content in order to take into account the information present in logical structure Our approach extends the traditional document representation model called Vector Space Model VSM We have tried to integrate structural information in all phases of document representation construction Feature extraction procedure Feature selection Feature weighting Our second contribution concerns to apply our generic approach to a real domain of technical documentation We desire to use our proposition for classifying technical documents electronically saved in CONTINEW society specialized in technical document audit These documents are in legacy format in which logical structure is inaccessible Then we propose an approach for document understanding in order to extract documents logical structure from their presentation layout Thus a collection of heterogeneous documents in different physical presentations and formats is transformed to a homogenous XML collection sharing the same logical structure Our contribution is based on learning approach where each logical element is described by its physical characteristics Therefore our proposal supports whole document transformation workflow from document s original format to being classified In our system SVM has been used as classification algorithm *Sams Teach Yourself Xml in 24 Hours* Charles Ashbacher, Learn the fundamental concepts of XML using practical hands on examples **Enhancing XML Preservation and Workflows** Viacheslav Zholudev,2012 With the proliferation of computers and networked resources the amount of data available on personal computers and on the Web is growing exponentially Handling of data becomes more complex as the scale expands Moreover data collections change in place over time so that one of the important challenges consists in supporting a life cycle of data In particular relevant parts of information have to be preserved and made accessible for future retrieval XML is a wide spread language for encoding documents that is both machine readable and human readable It plays a unique role on the Web and in other areas of digital life publishers libraries warehouses technical writers to name a few all make extensive use of XML for encoding books articles product information documentation interchanging and transformation of data and the extraction and aggregation of relevant pieces of information Contemporary web services are stepping away from traditional relational data models and are moving towards semi structured data representations and utilization of NoSQL and in particular XML databases for persisting data A considerable technological stack has been built around XML making it even stronger as a format The development of XML technologies specifications is a never ending process and emerging implementations of them push the progress further However there are still many open problems and challenges to be addressed in the XML domain This thesis selects a number of the unsolved ones and suggests

solutions concretely i Versioning support for XML ii XML databases views as counterparts of relational database views iii Support for XML document templating Solving the XML versioning problem for a subset of use cases enables an XML persistence layer that tracks the history of changes and provides XML database functionality like querying or indexing of data The XML database views concepts allows to abstract away from the notion of XML files and think in terms of customizable and editable abstract XML entities with origins in some XML documents Finally support for XML document templating facilitates separation of responsibilities while authoring XML documents Being able to use diverse expertise of developers in different phases of document creation in turn optimizes the whole authoring workflow Highlighting the practical value of this work all the concepts described in this thesis are implemented and integrated into the TNTBase system Over the last 4 years TNTBase has been constantly utilized in a number of mainly research projects maturing by receiving feedback from its users The main target of the TNTBase project was providing a versioned repository for the Open Mathematical Documents OMDoc with a strong focus on XML related functionality Since the OMDoc format combines data like aspects axioms theorems examples etc with document like aspects sections paragraphs etc the number of applications was diverse and therefore all the approaches have been generalized to make it possible to adapt TNTBase to other domains and XML languages As a result TNTBase has been deployed in multiple real life scenarios where it has been used on a daily basis   Validation of XML Document Based on Parallel Bit Stream Technology Shiyang Yang,2013 The validating of XML files is a main component of XML file processing This thesis investigates single instruction multiple data SIMD and parallel bit stream technologies in high performance XML validation The content model and datatypes of the schema are translated into regular expressions and then into parallel bitwise operations The element content and data of the instance file are extracted to form byte streams and then transformed into parallel bit streams Finally the parallel bitwise operations are applied on corresponding bit streams to validate the content model or datatype This method is then studied by changing the characteristic of the instance files such as the proportion of content data occurrences of elements Comparisons of the performance are also made with Xerces the well known XML parser with validator Whereas the parallel bit stream validation algorithm requires less than 20 cycles per byte while Xerces requires 40 to 300 cycles per byte
