Discussion The results of this study suggest that the use of a single, standardized, and validated questionnaire is a feasible and reliable method for assessing the prevalence of mental health problems in a community sample. The prevalence of mental health problems was found to be higher in the community sample than in the clinical sample, which is consistent with the findings of other studies. The results also suggest that the use of a single, standardized, and validated questionnaire is a feasible and reliable method for assessing the prevalence of mental health problems in a community sample.
