DSM-5 Criteria for Posttraumatic Stress Disorder Sarah Ann Sevedge,2021 In 1952 the American Psychiatric Association APA created the Diagnostic and Statistical Manual of Mental Disorders DSM in order to build a common language or discourse for the diagnosis of mental health disorders First the critical historical tracing of the DSM examines the etiology of the document to broaden our understanding of the discourse as a socially constructed narrative bound to historical context Secondly the task of the critical examination of the DSM 5 2013 diagnostic criteria for posttraumatic stress

disorder PTSD is to imagine how the language could change with the integration of theoretical frameworks provided by liberation psychology and postcolonial psychology The methodology for this review draws upon critical discourse analysis CDA which facilitates exploration of the relationship between themes in the discourse the transmission of knowledge within sociohistorical context and the subsequent power in shaping praxis It is necessary to refine our understanding of trauma and then build a cohesive definition of PTSD that reflects growth and development in knowledge The goal is to expand the definition of PTSD and include cosmologies of thought that have been historically denied access to authorship of the criteria and open a pathway to initiate systemic reforms which address the historical social political and economic factors that contribute to creating trauma The anticipated result of this effort is to help foster environments where it is possible for individuals and communities to be released from the machinations of trauma and increase available resources for healing

Keywords DSM 5 PTSD discourse postcolonial psychology liberation psychology *Posttraumatic Stress Disorder in Litigation* Robert I. Simon, 2008-08-13 The terrorist attacks on the World Trade Center in September 2001 turned PTSD into a household word But posttraumatic stress disorder has been documented throughout history For example as long ago as 1666 Samuel Pepys wrote in his diary that he still had night terrors 6 months after the great fire of London PTSD officially recognized as a diagnosis by DSM III in 1980 is only the most recent term used to describe the suffering of trauma victims Few could have foreseen its profound impact on litigation Often dubbed the black hole of litigation where allegations are relatively easy to assert but difficult to defend because the symptoms are subjective PTSD has deeply influenced civil and criminal law in cases ranging from malpractice and personal injury to sexual harassment and child abuse It is thus vital for all legal parties involved that forensic examiners perform credible psychiatric and psychological examinations of PTSD claimants Intended to add direction and discipline to the forensic assessment of PTSD litigants this expanded second edition begins with an updated chapter on current and future trends for the role of PTSD in litigation Chapter 2 notes the increasing evidence that exposure to multiple events not only is more common than previously thought but also increases the risk for development of PTSD following the target event Chapter 3 details diagnostic criteria and guidelines for the forensic psychiatric examination of the PTSD claimant Most literature discusses PTSD in adults Chapter 4 offers a rare perspective on PTSD in children and adolescents including parental response to the trauma developmental effects and delayed onset symptoms Forensic assessment of PTSD claimants is presented in Chapter 5 followed by new chapters on disability determinants how PTSD impairs occupational functioning and PTSD in the workplace where the causal relationship between employment stress and a resulting mental or emotional disorder must be determined Chapter 8 covers guidelines for malingering in PTSD where the claimant may be motivated by financial gain or by a reduced charge resulting from an insanity defense A new chapter on forensic laboratory testing in PTSD presents the tantalizing potential of psychophysiological measurement to redeem the PTSD diagnosis from its daunting subjectivity This essential collection by 13 U S experts sheds

important new light on forensic guidelines for effective assessment and diagnosis and determination of disability serving both plaintiffs and defendants in litigation involving PTSD claims Mental health and legal professionals third party payers and interested laypersons will welcome this balanced approach to a complex and difficult field **Trauma- and**

Subramaniam,2016-01-05 Seminar paper from the year 2015 in the subject Psychology Consulting and Therapy grade 61 University of Derby course Psychology language English abstract The Diagnostic and Statistical Manual of Mental Disorders estimated 9 11 % of the general population experience traumatic distress and about half of the people who experienced trauma continue to develop Posttraumatic stress disorder PTSD PTSD is an anxiety disorder for which cognitive behavioural therapy CBT is employed to treat or prevent maladaptive behaviour beliefs and thought processes According to the diagnostic criteria for PTSD individuals exposed to trauma experience three distinct types of persistent post trauma symptoms The arousal symptom clusters describe re experiencing traumatic moments nightmares flashbacks and sleep disturbances The second clusters of symptoms describe physiological responses such as helplessness anger outbursts concentration problems hyper vigilance and exaggerated startle responses The third cluster of symptoms describes avoidance and emotional numbing symptoms that leads to avoidance of people trauma reminders emotional dissociation and trouble recalling trauma events The persistent PTSD symptoms detrimentally affect mental health social behaviour and occupational functioning The issue whether PTSD symptoms own their existence to biological and learning or whether they are entirely cognitively determined has been the subject of much debate Each approach provides evidence supporting fear activation and problems in emotion regulation leading to various symptoms of PTSD but these findings do not settle the issue for the maintenance of persistent symptoms of PTSD In fact it is posited that individual differences in the appraisal of trauma events and emotion regulation strategies determine the maintenance of the PTSD symptoms Hence the existing cognitive behaviour therapy for PTSD was conceptualised to provide clinicians and therapists with an evidence based framework that addresses individualised case formulation and treatment needs The purpose of this essay is to discuss and evaluate the theoretical findings and treatment models which contributed to the understanding of persistent symptoms of PTSD

Childhood Trauma in Mental Disorders Gianfranco Spalletta,Delfina Janiri,Federica Piras,Gabriele Sani,2020-08-29 This volume presents a comprehensive overview of childhood trauma considering the psychopathological definition and its neurobiological implications as well as its impact on different psychiatric disorders The focus on childhood trauma rather than that occurring in adulthood is important due to its general neuro psycho socio and its specific biological implications since trauma during childhood impacts directly on neurodevelopment It has been suggested that early life stress increases

vulnerability to psychiatric disorders however the exact mechanisms of this association are not yet completely understood Although childhood trauma could be considered too unspecific to be an important risk factor for individual psychiatric disorders since it seems to occur across the board it impacts differently on different psychiatric disorders and it can modulate their clinical expression Therefore the assessment of early trauma needs to be included in the clinical evaluation of patients with psychiatric disorders The volume will be an invaluable tool for psychiatrists helping them to select suitable pharmacological psychotherapeutic and rehabilitative treatments

Representation of Trauma and Recovery in Bryony Lavery's Play Frozen Katharina Dellbrügge,2010-02 Seminar paper from the year 2009 in the subject English Language and Literature Studies Literature grade 1 0 University of Cologne Englisches Seminar course Envisioning Mad Selves language English abstract Bryony Lavery s play Frozen consists of two acts and 30 scenes and was first performed by the Birmingham Repertory Theatre in 1998 The three main characters of the

play are Agnetha an American psychologist Nancy a mother whose ten year old daughter Rhona gets abused and killed and Ralph a sexual serial killer who also murdered Rhona All three of them can be regarded as traumatised characters and in the beginning of the play they are literally frozen However Lavery allows each of them to take a journey towards a melting of their frozen states The term paper investigates how the concept of trauma is represented in the play which in this case implies a focus on the illustration of the characters frozen states and their melting Therefore I will first provide an overview of the concept of trauma and will place Frozen into the context of Trauma Drama before I move on to a close reading of the play
