Deep Space Craft Dave Doody, 2010-04-03 Deep Space Craft opens the door to interplanetary flight. It looks at this world from the vantage point of real operations on a specific mission and follows a natural trail from the day to day working of this particular spacecraft through the functioning of all spacecraft to the collaboration of the various disciplines to produce the results for which a spacecraft is designed. These results are of course mostly of a scientific nature although a small number of interplanetary missions are also flown primarily to test and prove new engineering techniques. The author shows how in order to make sense of all the scientific data coming back to Earth the need for experiments and instrumentation arises and follows the design and construction of the instruments through to their placement and testing on a spacecraft prior to launch. Examples are given of the interaction between an instrument's science team and the mission's flight team to plan and specify observations, gather and analyze data in flight and finally present the results and discoveries to the scientific community. This highly focused insider's guide to interplanetary space exploration uses many examples of previous and current endeavors. It will enable the reader to research almost any topic related to spacecraft and to seek the latest scientific findings, the newest emerging technologies or the current status of a favorite flight. In order to provide easy paths from the general to the specific, the text constantly refers to the Appendices. Within the main text, the intent is general familiarization and categorization of spacecraft and instruments at a high level to provide a mental framework to place in context and understand any spacecraft and any instrument encountered in the reader's experience. Appendix A gives illustrated descriptions of many interplanetary spacecraft, some earth orbiters and ground facilities to reinforce the classification framework. Appendix B contains illustrated detailed descriptions of a dozen scientific instruments, including some ground breaking engineering appliances that have either already been in operation or are poised for flight. Each instrument's range of sensitivity in wavelengths of light etc. and its physical principles of operation are described. Appendix C has a few annotated illustrations to clarify the nomenclature of regions and structures in the solar system and the planets' ring systems and places the solar system in context with the local interstellar environment.

Rocket and Spacecraft Propulsion Martin J. L. Turner, 2008-11-05 The revised edition of this practical hands on book discusses the range of launch vehicles in use today throughout the world and includes the very latest details of some of the advanced propulsion systems currently being developed. The author covers the fundamentals of the subject from the basic principles of rocket propulsion and vehicle dynamics through the theory and practice of liquid and solid propellant motors to new and future developments. The revised edition will stick to the same principle of providing a serious exposition of the principles and practice of rocket propulsion but from the point of view of the user and enquirer who is not an engineering specialist. Most chapters will remain substantially the same as the first edition; they will be updated where necessary and errata corrected. The main revisions will be to the chapter on electric propulsion where there have been significant new developments both in engine types and in practical applications. This is now seen as the key to planetary

exploration by robotic probes and should therefore be reflected Nuclear propulsion has emerged from the doldrums and is now seen as a definite possibility for outer solar system robotic exploration and as enabling technology for a human mars expedition A new chapter on nuclear thermal propulsion has been added to reflect this revival of interest *Scientific and Technical Aerospace Reports* ,1967 Proceedings of the First National Conference on the Peaceful Uses of Space United States.
