Extending Span Ranges of Precast Prestressed Concrete Girders Reid W. Castrodale,Christopher D. White,National Cooperative Highway Research Program,2004 At head of title National Cooperative Highway Research Program

Simplified Method to Develop Load and Resistance Factor Design Preliminary Design Charts for Prestressed Concrete Bridges Jorge Márquez Balderrama,2015 The 2011 PCI Bridge Design Manual provides preliminary design charts for selecting the girder size and number of prestressing strands for a given span length and beam spacing but only for small letter f with hook subscript c 8 000 psi 55 2 MPa This single strength

limits the use of the charts particularly for states considering ultra high performance concrete UHPC Accordingly this dissertation presents a simplified procedure to develop preliminary design charts for prestressed concrete bulb tee girders considering service load stress limits flexural strength and stresses at release The results for a BT 72 beam are first compared with the 2003 PCI design charts originally developed based on the AASHTO Standard Specifications The procedure is then adapted to the AASHTO LRFD Bridge Design Specifications and verified with the prevailing 2011 PCI design charts Finally new LRFD charts are generated for NSC HPC and UHPC with 0 5 0 6 and 0 7 in 13 15 and 18 mm strands for simple and two span continuous bridges to illustrate the simplified procedure and potential impact of UHPC larger strand size and continuity on bridge girders The new LRFD charts are shown to be accurate for the design assumptions made since an excellent agreement within 2% and 4% resulted between the preliminary design charts developed in this study and those given in the 2003 and 2011 PCI Bridge Design Manuals The transition point is identified which provides the information needed for a designer to distinguish the zones between fully prestressed uncracked partially prestressed and non prestressed cracked members The preliminary design charts demonstrate the effect of using UHPC and or larger strand size and or two span continuous layouts The effect of implementing continuity with the combination of UHPC and a larger strand diameter was shown to be much more significant than just increasing the concrete compressive strength or the strand diameter or using two span continuous layouts However the use of longer full span girders poses significant challenges for fabrication transportation erection span to depth ratios and live and dead load deflections of prestressed concrete bridges and consequently should be considered carefully for the final design of the bridge **Accelerated Bridge**
