TYPE HA GENERATOR DIFFERENTIAL RELAY

CAUTION Before putting relays into service, remove all blocking which may have been inserted for the purpose of securing the parts during shipment, make sure that all moving parts operate freely, inspect the contacts to see that they are clean and close properly, and operate the relay to check the settings and electrical connections.

APPLICATION

The type HA relays are balanced-beam type relays used for the differential protection of a-c generators and synchronous motors. The relays operate in one cycle (60-cycle per second bases) and are designed so that they are unaffected by d-c transients associated with asymmetrical through short-circuit currents.

The type HA relays may be applied when there is considerable difference between current transformer performance on the two sides of the machine. The limits of variation in the output of these current transformers which will still allow ample safety factors may be determined as follows.

Current transformer burden in ohms should not exceed $(N_p V_{CL})/133$; further the burden factor, BF, should not differ by more than a 2 to 1 ratio between the two sets of CT's. The above terms are defined as:

- N_p = proportion of total number of CT turns in use
 V_{CL} = current transformer 10L accuracy class voltage
 $BF = \frac{1000 R_B}{N_p V_{CL}}$
 R_B = resistance of the burden, excluding CT winding resistance.

For example, if the 400/5 tap of a 600/5 multi-ratio CT is used, $N_p = 400/600 = 0.67$. If this CT has a 10L200 rating, $V_{CL} = 200$, and the burden should not exceed:

$$\frac{N_p V_{CL}}{133} = \frac{0.67 \times 200}{133} = 1.0 \text{ ohm}$$

Assuming a resistance burden of $R_B = 0.5$ ohms, the burden factor, BF, is:

$$BF = \frac{1000 R_B}{N_p V_{CL}} = \frac{1000 \times 0.5}{0.67 \times 200} = 3.8$$

The other set of CT's may then have a burden factor as high as $2 \times 3.8 = 7.6$, or as low as $1/2 \times 3.8 = 1.9$. If the other set of CT's also has a burden of 0.5 ohms, a 10L100, 10L200, or 10L400 rating would be satisfactory, since the burden factors are 7.6, 3.8 and 1.9, respectively.

In calculating the burden, use the one way lead burden.

CONSTRUCTION

The type HA relay consists of three differential units, three saturating transformers, three fault detectors, an auxiliary contactor switch, and three operation indicators.

Differential Units

A beam of magnetic material, pivoted in the center is pulled down on the contact end by a current-operating coil. This force is opposed by a restraining force produced by two restraining coils acting on the other end of the beam. One restraining coil is connected in series with a capacitor and this combination in parallel with the other coil. The capacitor shifts the phase angle of one of the restraining circuits so that a uniform restraint is provided at all parts of the cycle.

The moving contact is a hollow, silver egg-shaped capsule partially filled with tungsten powder and is mounted on the beam. When this contact strikes the rigid stationary contact, the movement of the tungsten powder creates sufficient friction to absorb practically all the energy of impact. Thus, the tendency of the contact to bounce is reduced to a minimum. This moving contact projects thru a Micarta arm and is free to move against a leaf spring, thus providing contact follow. With this construction
