

## The Digestive System

**Anus** - the opening at the end of the digestive system from which feces exit the body.

**Appendix** - a small sac located near the start of the large intestine.

**Esophagus** - the long tube between the mouth and the stomach.

**Gall bladder** - a small, sac-like organ located by the duodenum. It stores and releases bile (a digestive chemical which is produced in the liver and breaks down lipids) into the small intestine.

**Large intestine** - the long, wide tube that food goes through after it goes through the small intestine. It absorbs water.

**Liver** - a large organ located above and in front of the stomach. It filters toxins from the blood, and makes bile (which breaks down fats) and some blood proteins.

**Mouth** - the first part of the digestive system, where food enters the body. Chewing and salivary enzymes in the mouth are the beginning of the digestive process (breaking down the food).

**Pancreas** - an enzyme-producing gland located below the stomach and above the intestines. Enzymes from the pancreas help in the digestion of carbohydrates, fats and proteins in the small intestine.

**Rectum** - the lower part of the large intestine, where feces are stored before they are excreted from the body.

**Small intestine** - the long, thin winding tube that food goes through after it leaves the stomach.

**Stomach** - a sack-like, muscular organ that is attached to the esophagus. When food enters the stomach, it is churned in an acid bath.
