Forthcoming Books Rose Arny,2000 *Information Hiding* David Aucsmith,2003-05-20 The mid 1990s saw an exciting convergence of a number of different information protection technologies whose theme was the hiding as opposed to encryption of information Copyright marking schemes are about hiding either copyright notices or individual serial numbers imperceptibly in digital audio and video as a component in intellectual property protection systems anonymous communication is another area of rapid growth with people designing systems for electronic cash digital elections and privacy in mobile communications security researchers are also interested in stray communication channels such as those which arise via shared resources in operating systems or the physical leakage of information through radio frequency emissions and finally many workers in these fields drew inspiration from classical hidden communication methods such as steganography and spread spectrum radio The first international workshop on this new emergent discipline of information hiding was organised by Ross Anderson and held at the Isaac Newton Institute Cambridge from the 30th May to the 1st June 1996 and was judged by attendees to be a successful and significant event In addition to a number of research papers we had invited talks from David Kahn on the history of steganography and from Gus Simmons on the history of subliminal channels We also had a number of discussion sessions culminating in a series of votes on common terms and definitions These papers and talks together with minutes of the discussion can be found in the proceedings which are published in this series as Volume 1174 **Books in Series** ,1985 Vols for 1980 issued in three parts Series Authors and Titles Control and Dynamic Systems V28 C.T. Leonides,2012-12-02 Control and Dynamic Systems Advances in Theory in Applications Volume 28 Advances in Algorithms and Computational Techniques in Dynamic Systems Control Part 1 of 3 discusses developments in algorithms and computational techniques for control and dynamic systems This book presents algorithms and numerical techniques used for the analysis and control design of stochastic linear systems with multiplicative and additive noise It also discusses computational techniques for the matrix pseudoinverse in minimum variance reduced order filtering and control decomposition technique in multiobjective discrete time dynamic problems computational techniques in robotic systems reduced complexity algorithm using microprocessors algorithms for image based tracking and modeling of linear and nonlinear systems This volume will be an important reference source for practitioners in the field who are looking for techniques with significant applied implications Digital Communication Edward A. Lee,David G. Messerschmitt,2012-12-06 This book concerns digital communication Specifically we treat the transport of bit streams from

one geographical location to another over various physical media such as wire pairs coaxial cable optical fiber and radio waves Further we cover the multiple access and synchronization issues relevant to constructing communication networks that simultaneously transport bit streams from many users The material in this book is thus directly relevant to the design of a multitude of digital communication systems including for example local and metropolitan area data networks voice and video telephony systems digital CATV distribution digital cellular and radio systems the narrowband and broadband integrated services digital network ISDN computer communication systems voiceband data modems and satellite communication systems We extract the common principles underlying these and other applications and present them in a unified framework This book is intended for designers and would be designers of digital communication systems To limit the scope to manageable proportions we have had to be selective in the topics covered and in the depth of coverage In the case of advanced information coding and detection theory for example we have not tried to duplicate the in depth coverage of many advanced textbooks but rather have tried to cover those aspects directly relevant to the design of digital communication systems
