

ELECTRICAL POWER

POWER AND CONTROL

GENERAL DESCRIPTION

PURPOSE

The electrical power system makes and supplies AC and DC power to aircraft. The system has automatic and manual controls and protection. A standby AC and DC system gives normal and emergency power.

AC POWER

The electrical power system has four main AC power sources and one standby power source. These are the main AC power sources and their supply capacity:

- Left integrated drive generator (IDG 1) (90 KVA).
- Right integrated drive generator (IDG 2) (90 KVA).
- APU starter-generator (90 KVA below 32,000 feet/9,753 meters, and goes down to 60 KVA at 41,000 feet/12,496 meters).
- External power (90 KVA).

The IDGs and APU starter-generator supply a 3 phase, 115/200 volts (nominal) at 400 Hz. The AC power system design prevents two sources to the same load at the same time.

The static inverter supplies a one phase, 115V AC output to the AC standby bus.

DC POWER

These transformer rectifier units (TRUs) change 115V AC to 28V DC. The aircraft also has these DC power sources:

- Main battery.
- Main battery charger.

- Auxiliary battery.
- Auxiliary battery charger.

The batteries are the backup DC source if other sources do not operate. The standby power control unit (SPCU) controls the distribution of DC power.

STANDBY POWER

With the loss of normal power, the standby power system supplies a minimum of 60 minutes of AC and DC power to systems necessary to maintain safe flight. The batteries supply DC power. The static inverter uses battery power to make AC power. The SPCU controls the distribution of AC and DC standby power.

PROTECTION

The electrical power system uses automatic control to protect the system from source failure or load failure.

These line replaceable units (LRUs) supply the system with protection and control logic:

- Left generator control unit (GCU 1).
- Right generator control unit (GCU 2).
- APU generator control unit (AGCU).
- Bus power control unit (BPCU).
- Standby power control unit (SPCU).
- Start converter unit (SCU).

The GCUs monitor the system to control and protect the IDGs. The APU GCU and the starter converter unit (SCU) work together to control and protect the APU starter generator.

The bus power control unit (BPCU) controls and monitors the use of external power.

The BPCU protects the aircraft from external power whose quality is out of limits.
