Spatio-temporal Development and Ecological Functions of Soil Surface Microbial Communities across Different Scales

Shubin Lan,David R. Elliott,Sonia Chamizo,Vincent John Martin Noah Linus Felde,Andrew David Thomas,2024-08-09

Biological soil crusts biocrusts are widely distributed throughout the world and cover approximately 12% of the terrestrial surface Biocrusts are composed of cyanobacteria algae lichens mosses and a great diversity of other microorganisms which

bind soil particles together to form a layer of biological soil matrix on the soil surface typically of several millimetres

thickness They are important sites of regional and global microbial diversity and perform multiple ecological functions

multifunctionality During the evolution of terrestrial life on earth biocrusts are regarded as the main colonising

photosynthetic organisms before the advent of vascular vegetation They not only represent the early stages of terrestrial

ecosystems but also facilitate the ecosystem s development and succession Therefore biocrusts are recognised as ecological

engineers in the natural development of ecosystems and for the restoration of degraded terrestrial ecosystems The

development of biocrusts is highly heterogeneous which is reflected on both temporal and spatial scales and this

heterogeneity is still clearly visible even in a small scale However up to now only limited knowledge is acquired on biocrust

temporal and spatial organisation In particular there still is a large knowledge gap regarding the various biocrust

communities under different developmental states and their related physiological metabolisms and ecological functions

Therefore in depth studies of these issues will undoubtedly further promote our understanding of the heterogeneous

development of biocrusts as well as their ecological multifunctionality in terrestrial ecosystems The relevant contributions

are expected to provide a scientific basis for the management of biocrusts and technology development e g cyanobacteria

Jürg B. Logue,Stuart E. G. Findlay,Jérôme Comte,2016-01-20 Advances in next generation sequencing technologies omics and

bioinformatics are revealing a tremendous and unsuspected diversity of microbes both at a compositional and functional level

Moreover the expansion of ecological concepts into microbial ecology has greatly advanced our comprehension of the role

microbes play in the functioning of ecosystems across a wide range of biomes Super imposed on this new information about

microbes their functions and how they are organized environmental gradients are changing rapidly largely driven by direct

and indirect human activities In the context of global change understanding the mechanisms that shape microbial communities is pivotal to predict microbial responses to novel selective forces and their implications at the local as well as global scale One of the main features of microbial communities is their ability to react to changes in the environment Thus many studies have reported changes in the performance and composition of communities along environmental gradients However the mechanisms underlying these responses remain unclear It is assumed that the response of microbes to changes in the environment is mediated by a complex combination of shifts in the physiological properties single cell activities or composition of communities it may occur by means of physiological adjustments of the taxa present in a community or selecting towards more tolerant better adapted phylotypes Knowing whether certain factors trigger one many or all mechanisms would greatly increase confidence in predictions of future microbial composition and processes This Research Topic brings together studies that applied the latest molecular techniques for studying microbial composition and functioning and integrated ecological biogeochemical and or modeling approaches to provide a comprehensive and mechanistic perspective of the responses of micro organisms to environmental changes This Research Topic presents new findings on environmental parameters influencing microbial communities the type and magnitude of response and differences in the response among microbial groups and which collectively deepen our current understanding and knowledge of the underlying mechanisms of microbial structural and functional responses to environmental changes and gradients in both aquatic and terrestrial ecosystems The body of work has furthermore identified many challenges and questions that yet remain to be addressed and new perspectives to follow up on
