

Applying Probability Concepts

Did you know that all 50 states in the United States have some sort of state fair? Fairs and carnivals include a variety of games of chance that aren't typically "fair." What does it mean for a game to be fair? In this task, you'll analyze different scenarios to determine fairness. You will use probability and expected value to make these determinations. You will also use these concepts to make decisions.

As you complete the assignment, keep this question in mind:

How can probability be applied to decision making?

Directions

Complete each of the following tasks, reading the directions carefully as you go. Show all work where indicated, including inserting images of graphs. Be sure that all graphs or screenshots include appropriate information, such as titles, labeled diagrams, etc. If your word processing program has an equation editor, you can insert your equations here. Otherwise, print this activity sheet and write your answers by hand.

In addition to the answers you determine, you will be graded based on the work you show, or your solution process. So, be sure to show all your work and answer each question as you complete the task. Type all your work into this document so you can submit it to your teacher for a grade. You will be given partial credit based on the work you show and the completeness and accuracy of your explanations.

Your teacher will give you further directions about how to submit your work. You may be asked to upload the document, e-mail it to your teacher, or print it and hand in a hard copy.

Now, let's get started!

Testing Shape Restriction Properties of Probability Distributions in a Unified Way Themistoklis Gouleakis,2015
We study the question of testing structured properties of discrete distributions Specifically given sample access to an arbitrary distribution D over n and a property P the goal is to distinguish between Building on a result of 9 we develop a general algorithm for this question which applies to a large range of shape constrained properties including monotone log concave t modal and Poisson Binomial distributions Our generic property tester works for properties that exclusively contain distributions which can be well approximated by L histograms for a small usually logarithmic in the domain size value of L The sample complexity of this generic approach is Moreover for all cases considered our algorithm has near optimal sample complexity Finally we also describe a generic method to prove lower bounds for this problem and use it to derive strong converses to our algorithmic results More specifically we use the following reduction technique we compose the property tester for a class C of distributions with an agnostic learner for that same class to get a tester for subset $CHARD\ C$ for which a lower bound is known *Probability Distributions: an Introduction to Probability Theory with Applications* Chris P.
