User Manual for Beta Version of TURBO-GRD ,1998 Perceptual Organization in Computer and Biological Vision
James Elder,Dirk Bernhardt-Walther,Anitha Pasupathy ,Mary A. Peterson,2024-08-22 A principal challenge for both biological and machine vision systems is to integrate and organize the diversity of cues received from the environment into the coherent global representations we experience and require to make good decisions and take effective actions Early psychological investigations date back more than 100 years to the seminal work of the Gestalt school Yet in the last 50 years neuroscientific and computational approaches to understanding perceptual organization have become equally important and a full understanding requires integration of all three approaches This highly interdisciplinary Research Topic welcomes contributions spanning Computer Science Psychology and Neuroscience with the aim of presenting a single unified collection that will encourage integration and cross fertilization across disciplines *Regional Assessment of Global Change Impacts*

Region H. Schreiber, 2012-12-06 The term dispersal centre literally refers to the place from which a dispersal process started. However, it also implies the location of a centre of diversity frequently even a recent one as well as the location of a preservation centre or refuge during regressive phases in less remote periods of earth's history and that of a possible speciation centre. The latter may have been the place of differentiation of subspecies or species provided that the isolation period has been sufficiently long. The term deliberately brings the dynamics to prominence which is inherent in the process of dispersal. This dynamics is neither properly recognized when considering ranges whose recent structures more or less force us to consider them as static entities (DE LATTIN 1967 p 16) nor adequately taken into account by systematic typology. Yet it is in fact the change that takes place in a range which is of great significance in evolutionary genetics. In the case of range regressions which may lead to a diminution or rupture of the range pattern according to the pressure of the endogenous or exogenous triggering factors, subsequently arising distribution obstacles may result in a geographical isolation of partial populations or population parts. Their sufficiently long spatial and reproductive isolation and the allele loss resulting from the change of the population size promote a divergent development. **Energy Research Abstracts**, 1984
