Comparing Irrational Numbers Ws:

The Second Kind of Impossible Paul Steinhardt, 2020-01-07 Shortlisted for the 2019 Royal Society Insight Investment Science Book Prize One of the most fascinating scientific detective stories of the last fifty years an exciting quest for a new form of matter A riveting tale of derring do Nature this book reads like James Gleick's *Chaos* combined with an Indiana Jones adventure When leading Princeton physicist Paul Steinhardt began working in the 1980s scientists thought they knew all the conceivable forms of matter *The Second Kind of Impossible* is the story of Steinhardt's thirty five year long quest to challenge conventional wisdom It begins with a curious geometric pattern that inspires two theoretical physicists to propose a radically new type of matter one that raises the possibility of new materials with never before seen properties but that violates laws set in stone for centuries Steinhardt dubs this new form of matter quasicrystal The rest of the scientific community calls it simply impossible *The Second Kind of Impossible* captures Steinhardt's scientific odyssey as it unfolds over decades first to prove viability and then to pursue his wildest conjecture that nature made quasicrystals long before humans discovered them Along the way his team encounters clandestine collectors corrupt scientists secret diaries international smugglers and KGB agents Their quest culminates in a daring expedition to a distant corner of the Earth in pursuit of tiny fragments of a meteorite forged at the birth of the solar system Steinhardt's discoveries chart a new direction in science They not only change our ideas about patterns and matter but also reveal new truths about the processes that shaped our solar system The underlying science is important simple and beautiful and Steinhardt's firsthand account is packed with discovery disappointment exhilaration and persistence This book is a front row seat to history as it is made Nature

An Exploration of Dynamical Systems and Chaos John H. Argyris, Gunter Faust, Maria Haase, Rudolf Friedrich, 2015-04-24 This book is conceived as a comprehensive and detailed text book on non linear dynamical systems with particular emphasis on the exploration of chaotic phenomena The self contained introductory presentation is addressed both to those who wish to study the physics of chaotic systems and non linear dynamics intensively as well as those who are curious to learn more about the fascinating world of chaotic phenomena Basic concepts like Poincaré section iterated mappings Hamiltonian chaos and KAM theory strange attractors fractal dimensions Lyapunov exponents bifurcation theory self similarity and renormalisation and transitions to chaos are thoroughly explained To facilitate comprehension mathematical concepts and tools are introduced in short sub sections The text is supported by numerous computer experiments and a multitude of graphical illustrations and colour plates emphasising the geometrical and topological characteristics of the underlying dynamics This volume is a completely revised and enlarged second edition which comprises recently obtained research results of topical interest and has been extended to include a new section on the basic concepts of probability theory A completely new chapter on fully developed turbulence presents the successes of chaos theory its limitations as well as future trends in the development of complex spatio temporal structures This book will be of valuable help for my lectures Hermann Haken Stuttgart This text

book should not be missing in any introductory lecture on non linear systems and deterministic chaos Wolfgang Kinzel Würzburg This well written book represents a comprehensive treatise on dynamical systems It may serve as reference book for the whole field of nonlinear and chaotic systems and reports in a unique way on scientific developments of recent decades as well as important applications Joachim Peinke Institute of Physics Carl von Ossietzky University Oldenburg Germany
