Computer And Communication Networks:

Computer Communication Networks R.L. Grimsdale, F.F. Kuo, 2012-03-14 In 1968 the Advanced Research Projects Agency ARPA of the U S Department of Defense began implementation of a computer communication network which permits the interconnection of heterogeneous computers at geographically distributed centres throughout the United States This network has come to be known as the ARPANET and has grown from the initial four node configuration in 1969 to almost forty nodes including satellite nodes in Hawaii Norway and London in late 1973 The major goal of ARPANET is to achieve resource sharing among the network users The resources to be shared include not only programs but also unique facilities such as the powerful ILLIAC IV computer and large global weather data bases that are economically feasible when widely shared The ARPANET employs a distributed store and forward packet switching approach that is much better suited for computer communications networks than the more conventional circuit switching approach Reasons favouring packet switching include lower cost higher capacity greater reliability and minimal delay All of these factors are discussed in these Proceedings

Communication Networks and Computer Systems Javier A. Barria, 2006 Communication networks and computer systems research is entering a new phase in which many of the established models and techniques of the last twenty years are being challenged The research community is continuing to free itself from past intellectual constraints so that it may fully exploit the convergence of computing and communications Evaluating the performance of emerging communications and computer systems constitutes a huge challenge Thus current research provides a set of heterogeneous tools and techniques embracing the uncertainties of time and space varying environments when the requests for diverse services are made in real time and with very different quality of service expectations These novel techniques will lead to fast and economic service deployment and effective dynamic resource management and hence to new business strategies and infrastructures that will facilitate the emergence of future services and applications This volume contains contributions and presentations made by leading international researchers at a workshop which was held in April 2004 to honour Professor Erol Gelenbe on the occasion of his inaugural lecture as the Dennis Gabor Chair at Imperial College London

Analysis of Computer and Communication Networks Fayez Gebali, 2008-06-24 The purpose of this book is to give the reader two things to paraphrase Mark Twain Roots to know the basics of modeling networks and Wings to fly away and attempt modeling other proposed systems of interest The Internet phenomenon is affecting us all in the way we communicate conduct business and access information and entertainment More unforeseen applications are still to come All of this is due to the existence of an efficient global high performance network that connects millions of users and moves information at a high rate with small delay High Performance Networks A high performance network is characterized by two performance measures bandwidth and delay Traditional network design focused mainly on bandwidth planning the solution to network problems was to add more bandwidth Nowadays we have to consider message delay particularly for delay sensitive applications such as voice and real time video Both bandwidth and delay contribute to the performance of the network Bandwidth can be easily increased by compressing the data by using links with higher speed or by transmitting several bits in parallel using sophisticated modulation techniques Delay however is not so easily improved It can only be reduced by the use of good scheduling protocols very fast hardware and switching equipment throughout the network The increasing use of optical fibers means that the transmission channel is close to ideal with extremely high bandwidth and low delay speed of light The areas that need optimization are the interfaces and devices that connect the different links together such as hubs switches routers and bridges

Analysis of Computer and Communication Networks Faye Gebali, 2008-11-01 Analysis of Computer and Communication Networks provides the basic techniques for modeling and analyzing two of the fundamental components of high performance networks switching equipment and software employed at the end nodes and intermediate switches The book also reviews the design options used to build efficient switching equipment Topics covered include Markov chains and queuing analysis traffic modeling interconnection networks and switch architectures and buffering strategies This book covers the mathematical theory and techniques necessary for analyzing telecommunication systems Queuing and Markov

chain analyses are provided for many protocols currently in use The book then discusses in detail applications of Markov chains and queuing analysis to model more than 15 communications protocols and hardware components

Computer Communications and Networks John R. Freer, 2012-12-06 Computer communications is one of the most rapidly developing technologies and it is a subject with which everyone in the computer systems profession should be familiar Computer communications and networks is an introduction to communications technology and system design for practising and aspiring computer professionals The subject is described from the computer system designer's point of view rather than from the communications engineer's viewpoint The presentation is suitable for introductory reading as well as for reference The emphasis is on practical rather than theoretical aspects and on technology which will become more important in the future The majority of the subject matter applies to civil and military communications but some aspects which are unique to military applications have been included where considered significant Computer communications is a rapidly changing and highly complex subject Sufficient practical knowledge of the subject is not usually gained at university or college but is generally developed over a period of several years by trial and error attending courses reading reference books and journals this book attempts to simplify and speed up the process by bringing together a body of information which is otherwise distributed throughout many books and journals The information is presented in a framework which makes a wider understanding of the subject possible Basic knowledge of communications is assumed a general familiarity with computer systems is anticipated in later chapters and where relevant theory is explained
