*Computer Applications in Instruction* Judith B. Edwards, 1978. Intended for upper elementary and secondary teachers in all subject areas, this guide provides practical advice on determining the appropriate application of computer technology and on the selection of specific subject-related computer-based instructional units. Under the heading of hardware and software, topics discussed include communicating with a computer, computer size, getting and using user's programs, translators, and programming languages, and the elements of a program. The computer is analyzed in terms of its uses as instructor, laboratory calculator, object of instruction, and instructor's aide. The selection of computer-based instructional units is described from the beginning of the selection process through final decision making. Individual papers then focus on uses of the computer in the following specific areas: art education, business education, instruction for the deaf and hard of hearing, elementary school language arts, mathematics curriculum and instruction, music education, physical education, secondary science, natural science, and the social sciences. Keys to Recognizing General Purpose Languages and some primary sources of computer-based instructional units are appended. Singh, 1996. The Institute of Food Technologists (IFT) recently endorsed the use of computers in food science education. The minimum standards for degrees in food science as suggested by IFT require the students to use computers in the solution of problems, the collection and analysis of data, the control processes, in addition to word processing. Because they are widely used in business, allow statistical and graphical representation of experimental data, and can mimic laboratory experimentation, spreadsheets provide an ideal tool for learning the important features of computers and programming. In addition, they are ideally suited for food science students who usually do not have an extensive mathematical background. Drawing from the many courses he has taught at UC Davis, Dr. Singh covers the general basics of spreadsheets using examples specific to food science. He includes more than 50 solved problems drawn from key areas of food science, namely food microbiology, food chemistry, sensory evaluation, statistical quality control, and food engineering. Each problem is presented with the required equations and detailed steps necessary for programming the spreadsheet. Helpful hints in using the spreadsheets are also provided throughout the text. **Computer Applications in Occupational Therapy** Florence S. Cromwell, 1986. Here is an
