Durham,1991 Charles Darwin s On the Origins of Species had two principal goals to show that species had not been separately created and to show that natural selection had been the main force behind their proliferation and descent from common ancestors In Coevolution the author proposes a powerful new theory of cultural evolution that is of the descent with modification of the shared conceptual systems we call cultures that is parallel in many ways to Darwin s theory of organic evolution The author suggests that a process of cultural selection or preservation by preference driven chiefly by choice or imposition depending on the circumstances has been the main but not exclusive force of cultural change He shows that this process gives rise to five major patterns or modes in which cultural change is at odds with genetic change Each of the five modes is discussed in some detail and its existence confirmed through one or more case studies chosen for their heuristic value the robustness of their data and their broader implications But Coevolution predicts not simply the existence of the five modes of gene culture relations it also predicts their relative importance in the ongoing dynamics of cultural change in particular cases The case studies themselves are lucid and innovative reexaminations of an array of oft pondered anthropological topics plural marriage sickle cell anemia basic color
