Entire Functions of Several Complex Variables Pierre Lelong, Lawrence Gruman, 2012-12-06

I Entire functions of several complex variables constitute an important and original chapter in complex analysis. The study is often motivated by certain applications to specific problems in other areas of mathematics: partial differential equations via the Fourier-Laplace transformation and convolution operators; analytic number theory and problems of transcendence or approximation theory; just to name a few. What is important for these applications is to find solutions which satisfy certain growth conditions. The specific problem defines inherently a growth scale and one seeks a solution of the problem which satisfies certain growth conditions on this scale and sometimes solutions of minimal asymptotic growth or optimal solutions in some sense. For one complex variable the study of solutions with growth conditions forms the core of the classical theory of entire functions and historically the relationship between the number of zeros of an entire function  $f(z)$  of one complex variable and the growth of  $|f|$  or equivalently  $\log |f|$  was the first example of a systematic study of growth conditions in a general setting. Problems with growth conditions on the solutions demand much more precise information than existence theorems. The correspondence between two scales of growth can be interpreted often as a correspondence between families of bounded sets in certain Fréchet spaces. However for applications it is of utmost importance to develop precise and explicit representations of the solutions.

**Problems and Solutions for Complex Analysis** Rami Shakarchi, 2012-12-06. This book contains all the exercises and solutions of Serge Lang's *Complex Analysis*. Chapters I through VIII of Lang's book contain the material of an introductory course at the undergraduate level and the reader will find exercises in all of the following topics: power series, Cauchy's theorem, Laurent series, singularities and meromorphic functions, the calculus of residues, conformal mappings and harmonic functions. Chapters IX through XVI which are suitable for a more advanced course at the graduate level offer exercises in the following subjects: Schwarz reflection, analytic continuation, Jensen's formula, the Phragmén-Lindelöf theorem, entire functions, Weierstrass products and meromorphic functions, the Gamma function and the Zeta function. This solutions manual offers a large number of worked-out exercises of varying difficulty. I thank Serge Lang for teaching me complex analysis with so much enthusiasm and passion and for giving me the opportunity to work on this answer book. Without his patience and help this project would be far from complete. I thank my brother Karim for always being an infinite source of inspiration and wisdom. Finally I want to thank Mark McKee for his help on some problems and Jennifer Baltzell for the many years of support, friendship and complicity. Rami Shakarchi, Princeton, New Jersey, 1999.
