Java Network Programming and Distributed Computing David Reilly, Michael Reilly, 2002 Java's rich comprehensive networking interfaces make it an ideal platform for building today's networked Internet centered applications, components, and Web services. Now two Java networking experts demystify Java's complex networking API, giving developers practical insight into the key techniques of network development and providing extensive code examples that show exactly how it's done. David and Michael Reilly begin by reviewing fundamental Internet architecture and TCP/IP protocol concepts all network programmers need to understand, as well as general Java features and techniques that are especially important in network programming such as exception handling and input/output. Using practical examples they show how to write clients and servers using UDP and TCP, how to build multithreaded network applications, and how to utilize HTTP and access the Web using Java. The book includes detailed coverage of server side application development, distributed computing development with RMI and CORBA, and email enabling applications with the powerful JavaMail API.
