Hromadka,2013-03-12 The Complex Variable Boundary Element Method or CVBEM is a generalization of the Cauchy integral formula into a boundary integral equation method or BIEM This generalization allows an immediate and extremely valuable transfer of the modeling techniques used in real variable boundary integral equation methods or boundary element methods to the CVBEM Consequently modeling techniques for dissimilar materials anisotropic materials and time advancement can be directly applied without modification to the CVBEM An extremely useful feature offered by the CVBEM is that the produced approximation functions are analytic within the domain enclosed by the problem boundary and therefore exactly satisfy the two dimensional Laplace equation throughout the problem domain Another feature of the CVBEM is the integrations of the boundary integrals along each boundary element are solved exactly without the need for numerical integration Additionally the error analysis of the CVBEM approximation functions is workable by the easy to understand concept of relative error A sophistication of the relative error analysis is the generation of an approximative boundary upon which the CVBEM approximation function exactly solves the boundary conditions of the boundary value problem of the Laplace equation and the goodness of approximation is easily seen as a closeness of fit between the approximative and true problem boundaries
