Taboada,2002-09 Low probability of intercept LPI is that property of an emitter that because of its low power wide bandwidth frequency variability or other design attributes makes it difficult to be detected or identified by means of passive intercept devices such as radar warning electronic support and electronic intelligence receivers In order to detect LPI radar waveforms new signal processing techniques are required This thesis first develops a MATLAB toolbox to generate important types of LPI waveforms based on frequency and phase modulation The power spectral density and the periodic ambiguity function are examined for each waveforms These signals are then used to test a novel signal processing technique that detects the waveforms parameters and classifies the intercepted signal in various degrees of noise The technique is based on the use of parallel filter sub band arrays and higher order statistics third order cumulant estimator

Each sub band signal is treated individually and is followed by the third order estimator in order to suppress any symmetrical noise that might be present The significance of this technique is that it separates the LPI waveforms in small frequency bands providing a detailed time frequency description of the unknown signal Finally the resulting output matrix is processed by a feature extraction routine to detect the waveforms parameters Identification of the signal is based on the modulation parameters detected   **Book Review Index Cumulation** Dana Ferguson,2005-09 Book Review Index provides quick access to reviews of books periodicals books on tape and electronic media representing a wide range of popular academic and professional interests The up to date coverage wide scope and inclusion of citations for both newly published and older materials make Book Review Index an exceptionally useful reference tool More than 600 publications are indexed including journals and national general interest publications and newspapers Book Review Index is available in a three issue subscription covering the current year or as an annual cumulation covering the past year   **Quantifying the Differences in Low Probability of Intercept Radar Waveforms Using Quadrature Mirror Filtering** Pedro Jarpa,2002-09-01 Low Probability of Intercept LPI radars are a class of radar systems that possess certain performance% characteristics causing them to be nearly undetectable by most modern digital intercept receivers Consequently LPI radar systems can operate undetected until the intercept receiver is much closer than the radar s target detector The enemy is thus faced with a significant problem To detect these types of radar new direct digital receivers that use sophisticated signal processing are required This thesis describes a novel signal processing architecture and shows simulation results for a number of LPI waveforms The LPI signal detection receiver is based on Quadrature Minor Filter Bank QMFB Tree processing and orthogonal wavelet techniques to decompose the input waveform into components representing the signal energy in rectangular tiles in the time frequency plane By analyzing the outputs at different layers of the tree it is possible to do feature extraction identify and classify the LPI waveform parameters and distinguish among the various LPI signal modulations Waveforms used as input signals to the detection algorithm include Frequency Modulated Continuous Wave Polyphase Codes Costas Codes and Frequency Shift Keying Phase Shift Keying waveforms The output matrices resulting from the most relevant layers of the QMFB tree processing are examined and the LPI modulation parameters are extracted under various signal to noise ratios
