

Overview of component creation

This chapter provides an overview of component design and the process of writing components for desktop applications. The material here assumes that you are familiar with C++ and its associated components.

- Class library
- Components and classes
- Creating components
- What gets into a component?
- Creating a new component
- Creating embedded components
- Creating installed components
- Installing a component on the Component platform

For information on installing user components, see “Installing component packages” on page 35-21 of the Developer's Guide.

Class library

Apple's components model is a component library that includes the Thread Component Library (TCL) and the Component Library for Cocoa/Carbon (CLC). Figure 1-1 shows the architecture of selected classes that make up the TCL framework. The CLC framework is similar to the TCL framework, but Windows controls are called *widgets* (instead of *views*) and are called *widgets* (instead of *views*) and are called *widgets* (instead of *views*). There are other differences, but a more detailed description of these frameworks and the associated architectures is given in Chapter 2, “A brief overview of programming the component system.” For an overview of how the frameworks differ from each other, see “TCL/CLC versus Windows” on page 35-27 of the Developer's Guide and also for the TCL and CLC differences for details on the components.
