Advanced Topics in Artificial Intelligence Norman Foo, 2007-12-07 The 12th Australian Joint Conference on Artificial Intelligence AI QQ held in Sydney Australia 6-10 December 1999 is the latest in a series of annual regional meetings at which advances in artificial intelligence are reported. This series now attracts many international papers and indeed the constitution of the program committee reflects this geographical diversity. Besides the usual tutorials and workshops, this year the conference included a companion symposium at which papers on industrial applications were presented. The symposium papers have been published in a separate volume edited by Eric Tsui. Ar99 is organized by the University of New South Wales and sponsored by the Australian Computer Society, the Commonwealth Scientific and Industrial Research Organisation, CSIRO Computer Sciences Corporation, the KRRU group at Griffith University, the Australian Artificial Intelligence Institute, and Neuron Works Ltd. Ar99 received over 120 conference paper submissions of which about one-third were from outside Australia. From these 39 were accepted for regular presentation and a further 15 for poster display. These proceedings contain the full regular papers and extended summaries of the poster papers. All papers were refereed mostly by two or three reviewers selected by members of the program committee, and a list of these reviewers appears later. The technical program comprised two days of workshops and tutorials followed by three days of conference and symposium plenary and paper sessions.

Advanced Topics in Computational Number Theory Henri Cohen, 2012-10-29 The computation of invariants of algebraic number fields such as integral bases, discriminants, prime decompositions, ideal class groups and unit groups is important both for its own sake and for its numerous applications. For example, to the solution of Diophantine equations. The practical completion of this task, sometimes known as the Dedekind program, has been one of the major achievements of computational number theory in the past ten years thanks to the efforts of many people. Even though some practical problems still exist, one can consider the subject as solved in a satisfactory manner and it is now routine to ask a specialized Computer Algebra System such as Kant, Kash, LiDIA, Magma or Pari GP to perform number field computations that would have been unfeasible only ten years ago. The very numerous algorithms used are essentially all described in *A Course in Computational Algebraic Number Theory* GTM 138 first published in 1993, third corrected printing 1996, which is referred to here as CohO. That text also treats other subjects such as elliptic curves, factoring and primality testing. It is important and natural to generalize these algorithms. Several generalizations can be considered but the most important are certainly the generalizations to global function fields, finite extensions of the field of rational functions in one variable over a finite field and to relative extensions of number fields. As in CohO, in the present book we will consider number fields only and not deal at all with function fields.
