Kirby, Torben Pätz, 2017-07-13 In image processing and computer vision applications such as medical or scientific image data analysis as well as in industrial scenarios images are used as input measurement data It is good scientific practice that proper measurements must be equipped with error and uncertainty estimates For many applications not only the measured values but also their errors and uncertainties should be and more and more frequently are taken into account for further processing This error and uncertainty propagation must be done for every processing step such that the final result comes with a reliable precision estimate The goal of this book is to introduce the reader to the recent advances from the field of

uncertainty quantification and error propagation for computer vision image processing and image analysis that are based on partial differential equations PDEs It presents a concept with which error propagation and sensitivity analysis can be formulated with a set of basic operations The approach discussed in this book has the potential for application in all areas of quantitative computer vision image processing and image analysis In particular it might help medical imaging finally become a scientific discipline that is characterized by the classical paradigms of observation measurement and error awareness This book is comprised of eight chapters After an introduction to the goals of the book Chapter 1 we present a brief review of PDEs and their numerical treatment Chapter 2 PDE based image processing Chapter 3 and the numerics of stochastic PDEs Chapter 4 We then proceed to define the concept of stochastic images Chapter 5 describe how to accomplish image processing and computer vision with stochastic images Chapter 6 and demonstrate the use of these principles for accomplishing sensitivity analysis Chapter 7 Chapter 8 concludes the book and highlights new research topics for the future

Robust Background Subtraction with Foreground Validation for Urban Traffic Video ,2004 Identifying moving objects in a video sequence is a fundamental and critical task in many computer vision applications Background subtraction techniques are commonly used to separate foreground moving objects from the background Most background subtraction techniques assume a single rate of adaptation which is inadequate for complex scenes such as a traffic intersection where objects are moving at different and varying speeds In this paper we propose a foreground validation algorithm that first builds a foreground mask using a slow adapting Kalman filter and then validates individual foreground pixels by a simple moving object model built using both the foreground and background statistics as well as the frame difference Ground truth experiments with urban traffic sequences show that our proposed algorithm significantly improves upon results using only Kalman filter or frame differencing and outperforms other techniques based on mixture of Gaussians median filter and approximated media filter

**View Synthesis Using Stereo Vision** Daniel Scharstein,1999-06-09 Image based rendering as an area of overlap between computer graphics and computer vision uses computer vision techniques to aid in synthesizing new views of scenes Image based rendering methods are having a substantial impact on the field of computer graphics and also play an important role in the related field of multimedia systems for applications such as teleconferencing remote instruction and surgery virtual reality and entertainment The book develops a novel way of formalizing the view synthesis problem under the full perspective model yielding a clean linear warping equation It shows new techniques for dealing with visibility issues such as partial occlusion and holes Furthermore the author thoroughly re evaluates the requirements that view synthesis places on stereo algorithms and introduces two novel stereo algorithms specifically tailored to the application of view synthesis

**Transformational Models for Background Subtraction with Moving Cameras** Daniya Zamalieva,OhioLINK Electronic Theses and Dissertations Center,2014 Background subtraction is a commonly used technique in computer vision for detecting objects While there is an extensive literature regarding background subtraction most of the

existing methods assume that the camera is stationary This assumption limits their applicability for moving camera scenarios To overcome this limitation we approach the background subtraction problem from a geometric perspective and introduce multiple background transformation models that utilize various geometric relations Unlike previous methods the proposed algorithms do not rely on certain camera motions or assumptions about the scene geometry First we introduce a 2.5D background model that describes the scene in terms of both its appearance and geometry In this model the 3D scene is represented as a stack of parallel hypothetical planes so that each plane is associated with a homography transform A pixel that belongs to a background scene structure consistently maps between the consecutive frames based on the corresponding plane projective transformation with respect to the hypothetical plane it lies on This consistency in mapping is not expected for a moving object since its motion does not comply with the camera motion This observation disambiguates moving objects from the background

Shape Reconstruction from Apparent Contours Giovanni Bellettini,Valentina Beorchia,Maurizio Paolini,Franco Pasquarelli,2016-10-09 Motivated by a variational model concerning the depth of the objects in a picture and the problem of hidden and illusory contours this book investigates one of the central problems of computer vision the topological and algorithmic reconstruction of a smooth three dimensional scene starting from the visible part of an apparent contour The authors focus their attention on the manipulation of apparent contours using a finite set of elementary moves which correspond to diffeomorphic deformations of three dimensional scenes A large part of the book is devoted to the algorithmic part with implementations experiments and computed examples The book is intended also as a user's guide to the software code appcontour written for the manipulation of apparent contours and their invariants This book is addressed to theoretical and applied scientists working in the field of mathematical models of image segmentation      *Robust Background Subtraction for Moving Cameras and Their Applications in Ego-vision Systems* Hasan Sajid,2016
