Engineering Artificially Intelligent Systems William F. Lawless,James Llinas,Donald A. Sofge,Ranjeev Mittu,2021-11-16 Many current AI and machine learning algorithms and data and information fusion processes attempt in software to estimate situations in our complex world of nested feedback loops Such algorithms and processes must gracefully and efficiently adapt to technical challenges such as data quality induced by these loops and interdependencies that vary in complexity space and time To realize effective and efficient designs of computational systems a Systems Engineering perspective may provide a framework for identifying the interrelationships and patterns of change between components rather than static snapshots We must study cascading interdependencies through this perspective to understand their behavior and to successfully adopt complex system of systems in society This book derives in part from the presentations given at the AAAI 2021 Spring Symposium session on Leveraging Systems Engineering to Realize Synergistic AI Machine Learning Capabilities Its 16 chapters offer an emphasis on pragmatic aspects and address topics in systems engineering AI machine learning and reasoning data and information fusion intelligent systems autonomous systems interdependence and teamwork human computer interaction trust and resilience

Classical Continuum Mechanics Karan S. Surana,2022-01-24 This book provides physical and mathematical foundation as well as complete derivation of the mathematical descriptions and constitutive theories for deformation of solid and fluent continua both compressible and incompressible with clear distinction between Lagrangian and Eulerian descriptions as well as co and contra variant bases Definitions of co and contra variant tensors and tensor calculus are introduced using curvilinear frame and then specialized for Cartesian frame Both Galilean and non Galilean coordinate transformations are presented and used in establishing objective tensors and objective rates Convected time derivatives are derived using the conventional approach as well as non

Galilean transformation and their significance is illustrated in finite deformation of solid continua as well as in the case of fluent continua Constitutive theories are derived using entropy inequality and representation theorem Decomposition of total deformation for solid and fluent continua into volumetric and distortional deformation is essential in providing a sound general and rigorous framework for deriving constitutive theories Energy methods and the principle of virtual work are demonstrated to be a small isolated subset of the calculus of variations Differential form of the mathematical models and calculus of variations preclude energy methods and the principle of virtual work The material in this book is developed from fundamental concepts at very basic level with gradual progression to advanced topics This book contains core scientific knowledge associated with mathematical concepts and theories for deforming continuous matter to prepare graduate students for fundamental and basic research in engineering and sciences The book presents detailed and consistent derivations with clarity and is ideal for self study
