Delphi enables you to create robust database applications quickly and easily. Delphi database applications can connect directly to the following databases: Borland Paradox, dBase III, dBase IV, Microsoft Access, and Microsoft Visual FoxPro. The Delphi database components also work with various database servers such as Oracle, Sybase, Microsoft SQL Server, Informix, InterBase, and ODBC data sources. Delphi client applications can be used equally between relational and flat-file data-based client/server architectures, and from client/server or a single machine.

This chapter introduces Delphi's database tools, including the Data Access and Data Components component groups, the Table Editor, the Database Explorer, and the Database Administrator.

What you should know first

For Delphi, a database application is similar to that of any other Delphi application. This book assumes you understand the basic application development techniques covered in the Delphi 3 User's Guide, including:

- Creating applications using project files
- Creating forms and integrating them
- Creating and using menu commands, properties, and events
- Creating applications that use Visual Basic components

You also need to have some understanding of relational databases as represented by the rdbMS3000™ from Delphi database applications access, whether it is a desktop database such as dBASE or Paradox, or an SQL server. For information specific to building a client/server application with Delphi, see Chapter 6, "Building a Client/Server Application."

This book assumes you have a basic understanding of relational databases, database design, and data management. There are many other programming books covering these topics. If you need this basic information, consult them.
