Richie, Carsten Bokemeyer, 2010-10-12 The book covers the complete field of testis cancer including the germ cell tumors and the stromal tumors from epidemiology to new chemotherapeutic agents and schedules throughout genetic features risk factors risk adapted treatments role of different types of surgery and special clinical situations Special attention is focused on fertility issues late effects of the primary therapy and the economical aspects of the different treatment policies As a result of the third Consensus Conference a consensual follow up can be devised and a chapter dedicated to this controversial and not yet defined matter This book is the state of the art reference text on testis cancer and is an essential resource for all urologists medical oncologists and radio oncologists      **Testicular Cancer, An Issue of Urologic Clinics** Daniel W. Lin, 2015-07-29 This issue provides much needed updates since Dr Sheinfeld's issue published in 2007 Dr Lin has assembled expert authors to provide clinicians with the full breadth of clinical updates on testicular cancer New to this issue are articles on clinical outcomes survivorship and several articles on the management of Nonseminomatous Germ Cell Tumors      **Frequently Asked Questions About Testicular Cancer** Paula Johanson, 2007-08-15 Discusses testicular cancer providing information on what it is diagnosis and treatment of the ailment and how it affects one's life      **Modern Management of Testicular Cancer** Siamak Daneshmand, 2019-07-10 In consultation with Consulting Editor Dr Samir Taneja Dr Sia Daneshmand has put together a state of the art issue of the Urologic Clinics devoted to Modern Management of Testicular Cancer The issue focuses on surgical techniques and diagnostic modalities for testicular cancer Clinical review articles are specifically devoted to the following Imaging For Testicular Cancer Management of Stage I Germ Cell Tumors Management of Stage II Germ Cell Tumors Current Management Of Disseminated GCT Post Chemotherapy Resection of Residual Mass in NSGCT Indications For Surgery in Disseminated Seminoma Growing Teratoma Syndrome Management of The Primary Testicular Tumor High Dose Chemotherapy and Autologous Stem Cell Transplantation mRNA As Biomarkers For Germ Cell Tumors Minimally Invasive RPLND Is There a Role Complications of RPLND Preservation of Fertility in Testis Cancer Management Readers will come away with the latest information they need to optimize surgical and management outcomes in the patient with testicular cancer      **Testicular Cancer Research Trends** Paulo V. Brantus, 2007 Seminomas account for about 30-40% of all testicular tumours These are usually found in men in their 30s and 40s The condition is usually localised to the testes although in about 25% of cases it has spread to lymph nodes Non seminomas account for 60% of all testicular tumours subcategories of these tumours are listed below Non seminoma tumours often contain more than one of the following cell types Testicular cancer is an abnormal rapid and invasive growth of cancerous malignant cells in the testicles Embryonal

carcinoma about 20% of testicular cancers occurs in 20-30 year olds and is highly malignant. It grows rapidly and spreads to the lung and liver. Yolk sac tumour about 60% of all testicular cancers in young boys. Teratomata about 7% of testicular cancers in adult men and 40% in young boys. Choriocarcinoma is rare. Stromal cell tumours are a kind of tumour that is made of Leydig cells, testosterone secreting cells, Sertoli cells, cells where sperm matures and granulosa cells. These tumours account for only 3-4% of all testicular tumours. However, they do make up nearly 20% of all childhood testicular tumours. These tumours may secrete a hormone, estradiol, that can cause one of the symptoms of testicular cancer, gynecomastia, excessive development of breast tissue. This book presents leading edge research in the field. **What you need to know**

Pavone-MacAluso, 2013-11-27. The proceedings of this volume represent a record of a meeting in the Ettore Majorana center in Erice, Sicily, from 16-24 July 1983. This was the fifth course of the International School of Urology and Nephrology, the fourth in a series of meetings devoted to different aspects of Urological Oncology. Speakers and delegates came from nearly every part of the world and contributed to a detailed analysis of the current state of knowledge of tumors of the testicle and to the development of knowledge of cancer of the bladder, prostate and kidney. Previous volumes resulting from this series of meetings have been well received and the Editors hope that the reader may find the record of this meeting equally attractive. We are indebted to the Department of Medical Illustration, St James's University Hospital, for their kindness in producing several of the illustrations in this book. The editors are very grateful to Dr Cavallo of Palermo for the major part which he has played in preparing the index. M Pavone, MacAluso, P H Smith, M A Bagshaw. v. CONTENTS. I. TUMORS OF THE TESTIS. Ferlin, Carlo Foresta, 2015-10-29. Testicular cancer (TC) is the most common cancer in males aged 20-40 years with a worldwide incidence of 7.5 per 100,000, but the rates vary considerably between countries and ethnic groups and there is evidence also for an increasing incidence in last decades. About 95% of all TCs are represented by testicular germ cell tumors (TGCTs) which include seminoma and non-seminoma histological types. It is generally assumed that the development of TGCT is under endocrine control. In particular, unbalanced androgen/estrogen levels and/or activity are believed to represent the key events for TGCT development and progression. Furthermore, recent evidence has suggested genetic association of TGCT with variations in genes involved in hypothalamic-pituitary-testicular axis and steroidogenic enzymes. This recent evidence expands the current knowledge on the role of genetic contribution in testicular cancer susceptibility and supports the hypothesis that variations in hormone metabolism genes might change the hormonal environment implicated in testicular carcinogenesis. Therefore, hormonal carcinogenesis is an important and controversial area of current research in TGCT and

further attention is given to genetic factors influencing hormone related cancer risk The genetic component to TGCT is in general strong In fact although environmental factors clearly contribute to TGCT development and probably to its increasing incidence in some geographical areas the proportion of TGCT susceptibility accounted for by the genetic effects is estimated at 25% TGCT has high familial risks compared with most other cancer types that are generally no more than two fold brothers of individuals with TGCT have an 8 to 12 fold increased risk of disease and sons of affected individuals have a 4 to 6 fold increased risk Despite this strong familial relative risk early results from linkage studies identified a limited relationship with genetic factors suggesting that TGCT is a genetically complex trait However more recently four genome wide association studies GWAS from the UK and USA have reported association of TGCTs with six new loci KITLG SPRY4 BAK1 DMRT1 TERT and ATF7IP The strongest association for TGCT susceptibility was found for SNPs in KITLG ligand for the membrane bound receptor tyrosine kinase KIT gene with a greater than 2.5 fold increased risk of disease per major allele which is the highest reported for any cancer to date These studies are being now replicated by other researches and attention is given to the relationship between these genetic variations TGCT risk and frequently associated anomalies of the reproductive tract such as cryptorchidism and infertility Finally over the past few decades TCGT research has focused also on external environmental causes acting mainly as endocrine disruptors of androgen and oestrogen pathways even during the foetal development of the testis It is well known that the testicular dysgenesis syndrome TDS hypothesis proposed ten years ago suggests that disturbed testicular development in fetal life may result in one or more of four disorders postnatally named cryptorchidism hypospadias poor semen quality and TGCT These four disorders are therefore considered as one clinical entity and are linked together by epidemiological and pathophysiological relations The relative contribution of genetics and environment in TGCT development and the interactions between endocrine disruptors and variations in genes involved in hormonal carcinogenesis is therefore another interesting area of research
