

THE MAIN CIRCUIT

Operation layout and guideline for setting the main delivery system of the carburetor

Modern carburetors used on motorcycle engines are defined as "needle type" due to the mechanical configuration of the main delivery system. The tapered needle assures the correct mixture ratio for all operating conditions of the engine corresponding to openings of the accelerator from 1/4 up to wide open throttle.

THE TAPERED METERING ROD

As usual, the fuel is drawn into the venturi from the vacuum generated by the induced airflow, but from the moment that the throttle valve closes, the same vacuum changes within very wide limits. For small throttle openings the engine vacuum level is generally higher than when the valve is partially or fully lifted and subsequently, the fuel de-

livery from the nozzle of the main circuit changes proportionally. By responding only to the vacuum signal, a main circuit comprised of only the nozzle would deliver a lot of fuel at small and intermediate throttle openings, maintaining a rich mixture strength. At large openings, the delivery would decrease at the worst time, risking engine damage from a lean mixture.
