Delphi enables you to create robust database applications quickly and easily. Delphi database applications can connect directly to the following databases: Borland Paradox, dBase III, dBase IV, Microsoft Access, and Microsoft Visual FoxPro. The Delphi database components also work with various database servers such as Oracle, Sybase, Microsoft SQL Server, Informix, InterBase, and ODBC data sources. Delphi client applications can be used equally between relational and flat-file data-based client/server architectures, and from client/server or a single machine.

This chapter introduces Delphi's database tools, including the Data Access and Data Components component groups, the Table Editor, the Database Explorer, and the Database Administrator.

What you should know first

For Delphi, a database application is similar to that of any other Delphi application. This book assumes you understand the basic application development techniques covered in the Delphi 3 Users Guide, including:

- Creating applications using the IDE
- Creating forms and integrating them
- Creating, modifying, and removing components and controls
- Creating applications that use Visual Basic controls

You also need to have some understanding of the Database Manager provided by the rdbMS you use. Delphi database applications access, whether it is a desktop database such as dBase or Paradox, or an SQL server. For information specific to building client/server applications with Delphi, see Chapter 6, "Building a Client/Server Application."

This book assumes you have a basic understanding of relational databases, database design, and data management. There are many other topics that are relevant to developing database applications that are covered in books on these subjects.
